Preface	xv
I Introduction and Preliminary Concepts	1
1 Overview	3
1.1 The population approach	3
1.2 About models	8
1.2.1 Mixed effects models and hierarchical models . .	8
1.2.2 Description, representation and implementation of models	9
1.3 Tasks, methods and tools	11
1.3.1 Model coding	11
1.3.2 Model exploration	12
1.3.3 Modeling	12
1.3.4 Simulation	13
1.4 Contents of the book	14
2 Mixed Effects Models vs Hierarchical Models	17
2.1 From linear models to nonlinear mixed effects models .	17
2.1.1 Linear models	17
2.1.2 Nonlinear models	19
2.1.3 Linear mixed effects models	20
2.1.4 Nonlinear mixed effects models	22
2.2 From nonlinear mixed effects models to hierarchical models	23
2.3 From generalized mixed models to hierarchical models .	26
2.3.1 Generalized linear mixed models	26
2.3.2 Generalized nonlinear mixed models	27
3 What is a Model? A Joint Probability Distribution!	29
3.1 Introduction and notation	29
3.2 An illustrative example	31
3.2.1 A model for the observations from a single individual	31
3.2.2 A model for several individuals	32

3.2.3	A model for the population parameters	33
3.2.4	A model for the covariates	34
3.2.5	A model for the measurement times	35
3.2.6	A model for the dose regimen	35
3.2.7	A complete model	37
3.3	Using a model for executing tasks	37
3.3.1	Simulation	37
3.3.2	Estimation of the population parameters	39
3.3.3	Estimation of the individual parameters	40
3.3.4	Model selection	41
3.3.5	Optimal design	41
3.4	Implementing hierarchical models with MLXTRAN	42

II Defining Models 45

4	Modeling the Observations	47
4.1	Introduction	47
4.2	Models for continuous data	49
4.2.1	The data	49
4.2.2	The model	50
4.2.3	The structural model	50
4.2.4	The residual error model	52
4.2.5	The conditional density function	59
4.2.6	Transforming the data	60
4.2.7	Censored data	62
4.2.8	Extensions to multidimensional continuous observations	66
4.2.9	MLXTRAN for continuous data models	66
4.3	Models for count data	68
4.3.1	Modeling success and failure numbers	68
4.3.2	Modeling the number of events	71
4.3.3	MLXTRAN for count data models	74
4.4	Models for categorical data	75
4.4.1	Ordinal data	77
4.4.2	Markovian dependence	79
4.4.3	MLXTRAN for categorical data models	82
4.5	Models for time-to-event data	84
4.5.1	Single events	84
4.5.2	Repeated events	87
4.5.3	Censoring and probability distributions	88
4.5.4	Examples of survival models	90
4.5.5	MLXTRAN for time-to-event data models	93
4.6	Joint models	95

4.6.1	Introduction	95
4.6.2	Independent observations	96
4.6.3	Conditionally independent observations	98
4.6.4	Conditionally dependent observations	100
4.6.5	MLXTRAN for joint models	101
5	Modeling the Individual Parameters	103
5.1	Introduction	103
5.2	Gaussian models	105
5.2.1	The normal distribution	105
5.2.2	Extensions of the normal distribution	106
5.2.3	MLXTRAN for Gaussian models	110
5.3	Models with covariates	110
5.3.1	Introduction	110
5.3.2	Linear models for continuous covariates	111
5.3.3	Nonlinear models for continuous covariates	116
5.3.4	Models for categorical covariates	119
5.3.5	MLXTRAN for covariate models	120
5.4	Extensions to multivariate distributions	121
5.4.1	Gaussian models	121
5.4.2	The probability distribution function	123
5.4.3	MLXTRAN for multivariate normal distributions	125
5.5	Additional levels of variability	125
5.5.1	Modeling inter-occasion variability	125
5.5.2	Extensions to multiple levels of variability	131
5.5.3	MLXTRAN for multiple levels of variability	132
5.6	Different mathematical representations and implementations of the same model	133
5.6.1	Description of the statistical model	134
5.6.2	Representation of the statistical model	134
5.6.3	Which representation for which task?	135
5.6.4	Implementation of the statistical model	137
6	Extensions	139
6.1	Mixture models	139
6.1.1	Introduction	139
6.1.2	Mixtures of mixed effects models	140
6.1.3	Example 1: A mixture of normal distributions	143
6.1.4	Example 2: A mixture of structural models	146
6.2	Hidden Markov models	149
6.2.1	Introduction	149
6.2.2	Mixed hidden Markov models	149

6.2.3	Probability distribution function for the observations	151
6.2.4	Examples	151
6.3	Stochastic differential equation-based models	153
6.3.1	Introduction	153
6.3.2	Diffusion models	154
6.3.3	Diffusion models for dynamical systems with linear transfers	155
6.3.4	Mixed effects diffusion models	158
III	Using Models	161
7	Tasks and Methods	163
7.1	Introduction	163
7.2	Estimation	165
7.2.1	Maximum likelihood estimation of population parameters	165
7.2.2	Estimation of the Fisher information matrix	169
7.2.3	Bootstrapping	172
7.2.4	Bayesian estimation of population parameters	174
7.2.5	Estimation of the individual parameters	178
7.3	Model evaluation	180
7.3.1	Introduction	180
7.3.2	Model diagnostics	181
7.3.3	Model selection	194
7.3.4	Model building	197
8	Examples	201
8.1	Body weight curves in a toxicity study	201
8.1.1	Introduction	201
8.1.2	Using mixed effects models	202
8.1.3	Different parametrizations of the same structural model	207
8.1.4	Power analysis and equivalence testing	209
8.2	Joint PKPD modeling of warfarin data	212
8.2.1	Simultaneous PKPD modeling	213
8.2.2	Sequential PKPD modeling	220
8.2.3	Joint modeling of continuous PK and categorical PD data	221
8.3	Gene expression in single cells	223

9 Algorithms	231
9.1 Introduction	231
9.1.1 Notation	232
9.1.2 Different representations of the same model	232
9.1.3 Using nondegenerate statistical models	235
9.2 The SAEM algorithm for estimating population parameters	237
9.2.1 Introduction	237
9.2.2 The EM algorithm	238
9.2.3 The SAEM algorithm	239
9.2.4 Implementing SAEM	241
9.2.5 A simple example to understand why SAEM converges in practice	245
9.2.6 A simulated annealing version of SAEM	249
9.2.7 A parameter expansion version of SAEM	252
9.3 The Metropolis-Hastings algorithm for simulating the individual parameters	255
9.4 Estimation of the observed Fisher information matrix	259
9.4.1 Estimation using stochastic approximation	259
9.4.2 Estimation using model linearization	261
9.5 Estimation of the log-likelihood	262
9.5.1 Estimation using importance sampling	262
9.5.2 Estimation using model linearization	266
9.6 Examples of calculating the log-likelihood and its derivatives	266
9.6.1 Models with diagonal Ω	267
9.6.2 Linear models with covariates and nondiagonal Ω	269
9.7 Automatic construction of visual predictive checks	270
 IV Appendices	 277
A The Individual Approach	279
A.1 Models for the individual approach	280
A.2 Tasks and methods	281
A.3 A pharmacokinetics example	286
B Some Useful Results	295
B.1 Continuous probability distributions	295
B.2 Fisher information and maximum likelihood estimation	296
B.3 Computing the Hessian of the log-likelihood	298

C	Introduction to Pharmacokinetics Modeling	303
C.1	Introduction	303
C.2	Dynamical systems for characterizing the ADME process	304
C.3	Putting doses into a system	307
C.4	Implementing PK models with MLXTRAN	308
C.5	Using the same PK model for different tasks	311
D	Tools	315
D.1	MLXPLORE for model exploration	315
D.2	Simulx for data simulation	319
D.3	DATXPLORE for data visualization	323
D.4	MONOLIX for data modeling	325
	Bibliography	330
	Glossary	357
	Index	361
