 $\Rightarrow$  Mathematical theory of **Deterministic** Persistence

## Introduction

• An important issue in ecology is to find out

under which conditions a group of interacting species plants, animals, viral particles - can coexist.

• Classical approach to these questions has been the development of **Deterministic Models of Interaction** ODEs, PDEs, Difference equations, etc.

#### ⇒ Mathematical theory of **Deterministic** Persistence

• The theory began in the late 1970s and developed rapidly with the help of the available tools from dynamical system theory (see e.g the book by Smith and Thieme (2011)).

## Introduction

• To take into account **environmental fluctuations** one need to consider **Stochastic Models of Interaction** 

## Introduction

• To take into account **environmental fluctuations** one need to consider **Stochastic Models of Interaction** 

⇒ Mathematical theory of **stochastic** Persistence

The theory began to emerge with the work of Chesson, Ellner, and others in the  $80\,\mathrm{s}$ 

## Introduction

• To take into account **environmental fluctuations** one need to consider **Stochastic Models of Interaction** 

⇒ Mathematical theory of **stochastic** Persistence

The theory began to emerge with the work of Chesson, Ellner, and others in the 80s but, from a "math perspective", is still in its infancy

## Introduction

(...)

Logistic Rosenzweig Mac-Arthur Lotka-Volterra

# Verhulst (or logistic) dynamics

$$\frac{dx}{dt} = x(a - bx)$$

- $x \ge 0$ , abundance of the population,
- a = intrinsic growth rate,

 $b \ge 0$ 

**Logistic** Rosenzweig Mac-Arthur Lotka-Volterra

э

## Verhulst dynamics

$$\frac{dx}{dt} = x(a - bx)$$

 $ullet a < 0 \Rightarrow x(t) 
ightarrow 0$ : Extinction

•
$$a > 0 \Rightarrow x(t) \rightarrow \gamma := \frac{a}{b}$$
 Persistence

Logistic Rosenzweig Mac-Arthur Lotka-Volterra

(日) (同) (三) (

## Verhulst dynamics

$$\frac{dx}{dt} = x(a - bx)$$

 $\bullet a < 0 \Rightarrow x(t) \rightarrow 0$ : Extinction

•
$$a > 0 \Rightarrow x(t) \rightarrow \gamma := \frac{a}{b}$$
 Persistence

**Ok** but what does it mean if there is (stochastic) variability ?

Logistic Rosenzweig Mac-Arthur Lotka-Volterra

## Stochastic Variability

Variability of ecological processes may have different natures:

• Demographic Stochasticity

#### • Environmental Stochasticity

**Logistic** Rosenzweig Mac-Arthur Lotka-Volterra

## Stochastic Variability

Variability of ecological processes may have different natures:

• Demographic Stochasticity

Even if all individuals in a population are identical, the birth/death of each individual is a random event

#### • Environmental Stochasticity

**Logistic** Rosenzweig Mac-Arthur Lotka-Volterra

## Stochastic Variability

Variability of ecological processes may have different natures:

• Demographic Stochasticity

Even if all individuals in a population are identical, the birth/death of each individual is a random event

#### • Environmental Stochasticity

Light, precipitation, temperature, nutrient availability,

**Logistic** Rosenzweig Mac-Arthur Lotka-Volterra

# Stochastic Variability

Variability of ecological processes may have different natures:

• Demographic Stochasticity

Even if all individuals in a population are identical, the birth/death of each individual is a random event

 $\rightarrow$  Fascinating questions (mean-field approximations, branching, time to extinction, quasi-invariant measures, ) but not the subject of this course

• Environmental Stochasticity

Light, precipitation, temperature, nutrient availability,

**Logistic** Rosenzweig Mac-Arthur Lotka-Volterra

- $M_0$  is a closed set = extinction set
- $M_+ = M \setminus M_0$  = coexistence set

Framework Canonical models Stochastic Persistence H-persistence

#### Abstract Framework

•  $(X_t)$  a "good" (*Feller, cad-lag, good behavior at*  $\infty$ , *etc.*) Markov process on some "good" (*Polish, locally compact*) space

 $M = M_+ \cup M_0$ 

- $M_0$  is a closed set = extinction set
- $M_+ = M \setminus M_0$  = coexistence set
- Both  $M_0$  and  $M_+ = M \setminus M_0$  are invariant:

$$x \in M_0 \Rightarrow X_t^x \in M_0,$$
$$x \in M_1 \Rightarrow X_t^x \in M_1$$

• Furthermore, for some  $\alpha_i$  the corresponding RMA model has an attracting periodic or equilibrium  $\Gamma_i$ .  $\Gamma_i$  is accessible and the strong Bracket condition holds at  $\Gamma_i$ 

11

#### Corollary (Persistence)

If  $\langle \alpha, \nu \rangle < \frac{\gamma}{1+\gamma}$  both the empirical occupation measure and the law of  $X_t$  converge, as  $t \to \infty$  to  $\Pi(x)dx$  supported by  $M_+$ .

# Example: Rosenzweig Mac-Arthur with environmental stochasticity

• Furthermore, for some  $\alpha_i$  the corresponding RMA model has an attracting periodic or equilibrium  $\Gamma_i$ .  $\Gamma_i$  is accessible and the strong Bracket condition holds at  $\Gamma_i$ 

11

#### Corollary (Persistence)

If  $\langle \alpha, \nu \rangle < \frac{\gamma}{1+\gamma}$  both the empirical occupation measure and the law of  $X_t$  converge, as  $t \to \infty$  to  $\Pi(x)dx$  supported by  $M_+$ .

#### Corollary (Extinction)

If 
$$\langle \alpha, \nu \rangle > \frac{\gamma}{1+\gamma} X_t \to M_0$$

Example: Predator-Prey with Brownian perturbations

General prey growth rate

$$\frac{dx}{dt} = x(f(x) - \frac{y}{1+x})$$

$$\frac{dy}{dt} = y(-\alpha + \frac{x}{1+x})$$

Example: Predator-Prey with Brownian perturbations

General prey growth rate + Brownian perturbations

$$dx = x(f(x) - \frac{y}{1+x})dt + x\sigma dB_t$$

$$dy = y(-\alpha + \frac{x}{1+x})dt + y\sigma dB_t$$

 $\sigma << 1$
### Example: Predator-Prey with Brownian perturbations

• $f(0) < 0 \Rightarrow$  Ergodic measures on  $M_0 = \{\delta_{0,0}\}$ 

< /i>

### Example: Predator-Prey with Brownian perturbations

 $\bullet f(0) < 0 \Rightarrow$  Ergodic measures on  $M_0 = \{\delta_{0,0}\} \Rightarrow$  Extinction

### Example: Predator-Prey with Brownian perturbations

• $f(0) < 0 \Rightarrow$  Ergodic measures on  $M_0 = \{\delta_{0,0}\} \Rightarrow$  Extinction

Allee effect promotes extinction

Example: Predator-Prey with Brownian perturbations
