- ▶ We consider the **propagation of waves** in a 2D **acoustic** waveguide with an obstacle (also relevant in optics, microwaves, water-waves theory,...).

$$(\mathcal{P}) \left| \begin{array}{l} \Delta u + k^2 u = 0 \quad \text{in } \Omega, \\ \partial_n u = 0 \quad \text{on } \partial\Omega \end{array} \right.$$

- ▶ We fix  $k \in (0; \pi)$  so that only the plane waves  $e^{\pm ikx}$  can propagate.

- ▶ We consider the **propagation of waves** in a 2D **acoustic** waveguide with an obstacle (also relevant in optics, microwaves, water-waves theory,...).

$$(\mathcal{P}) \left| \begin{array}{l} \Delta u + k^2 u = 0 \quad \text{in } \Omega, \\ \partial_n u = 0 \quad \text{on } \partial\Omega \end{array} \right.$$

- ▶ We fix  $k \in (0; \pi)$  so that only the plane waves  $e^{\pm ikx}$  can propagate.
- ▶ The scattering of these waves leads us to consider the solutions of  $(\mathcal{P})$  with the decomposition

$$u_+ = \left| \begin{array}{l} e^{ikx} + R_+ e^{-ikx} + \dots \\ T e^{+ikx} + \dots \end{array} \right. \quad u_- = \left| \begin{array}{l} T e^{-ikx} + \dots \\ e^{-ikx} + R_- e^{+ikx} + \dots \end{array} \right. \quad \begin{array}{l} x \rightarrow -\infty \\ x \rightarrow +\infty \end{array}$$

$R_{\pm}, T \in \mathbb{C}$  are the **scattering coefficients**, the ... are expon. decaying terms.

- ▶ We have the relations of **conservation of energy**  $|R_{\pm}|^2 + |T|^2 = 1$ .
- Without obstacle,  $u_+ = e^{ikx}$  so that  $(R_+, T) = (0, 1)$ .
- With an obstacle, in general  $(R_+, T) \neq (0, 1)$ .

- ▶ We have the relations of **conservation of energy**  $|R_{\pm}|^2 + |T|^2 = 1$ .
- Without obstacle,  $u_+ = e^{ikx}$  so that  $(R_+, T) = (0, 1)$ .
- With an obstacle, in general  $(R_+, T) \neq (0, 1)$ .

---

## Goal of the talk

We wish to identify situations (geometries,  $k$ ) where  $R_{\pm} = 0$  and/or  $T = 1$  (as if there were no obstacle)  $\Rightarrow$  **cloaking at “infinity”**.

**Difficulty:** the scattering coefficients have a **non explicit** and **non linear** dependence wrt the geometry and  $k$ .

**Remark:** **different** from the **usual cloaking** picture (Pendry *et al.* 06, Leonhardt 06, Greenleaf *et al.* 09) because we wish to **control only the scattering coef.**

→ Less ambitious but doable without fancy materials (and relevant in practice).

# Outline of the talk

---

We present **two different** points of view on these questions of invisibility:

## 1 Cloaking of obstacles

### ASYMPTOTIC ANALYSIS:

$k$  and  $\Omega$  are given, we explain how to **perturb the geometry** using **thin resonant ligaments** to get  $T \approx 1$ .

## 2 A spectral approach to determine non reflecting wavenumbers

### SPECTRAL THEORY:

$\Omega$  is given, we explain how to **find non reflecting  $k$**  by solving an unusual **spectral problem**.

# Outline of the talk

---

We present **two different** points of view on these questions of invisibility:

## 1 Cloaking of obstacles

### ASYMPTOTIC ANALYSIS:

$k$  and  $\Omega$  are given, we explain how to **perturb the geometry** using **thin resonant ligaments** to get  $T \approx 1$ .

## 2 A spectral approach to determine non reflecting wavenumbers

### SPECTRAL THEORY:

$\Omega$  is given, we explain how to find **non reflecting  $k$**  by solving an **unusual spectral problem**.

# Setting

Main ingredient of our approach: **outer resonators** of width  $\epsilon \ll 1$ .

$$(\mathcal{P}^\epsilon) \quad \begin{cases} \Delta u + k^2 u = 0 & \text{in } \Omega^\epsilon, \\ \partial_n u = 0 & \text{on } \partial\Omega^\epsilon \end{cases}$$

► In this geometry, we have the scattering solutions

$$u_+^\epsilon = \begin{cases} e^{ikx} + R_+^\epsilon e^{-ikx} + \dots \\ T^\epsilon e^{+ikx} + \dots \end{cases} \quad u_-^\epsilon = \begin{cases} T^\epsilon e^{-ikx} + \dots & x \rightarrow -\infty \\ e^{-ikx} + R_-^\epsilon e^{+ikx} + \dots & x \rightarrow +\infty \end{cases}$$

# Setting

Main ingredient of our approach: **outer resonators** of width  $\epsilon \ll 1$ .

$$(\mathcal{P}^\epsilon) \left| \begin{array}{l} \Delta u + k^2 u = 0 \quad \text{in } \Omega^\epsilon, \\ \partial_n u = 0 \quad \text{on } \partial\Omega^\epsilon \end{array} \right.$$

► In this geometry, we have the scattering solutions

$$u_+^\epsilon = \begin{cases} e^{ikx} + R_+^\epsilon e^{-ikx} + \dots \\ T^\epsilon e^{+ikx} + \dots \end{cases} \quad u_-^\epsilon = \begin{cases} T^\epsilon e^{-ikx} + \dots & x \rightarrow -\infty \\ e^{-ikx} + R_-^\epsilon e^{+ikx} + \dots & x \rightarrow +\infty \end{cases}$$

In general, the thin ligament has only a **weak influence** on the scattering coefficients:  $R_\pm^\epsilon \approx R_\pm$ ,  $T^\epsilon \approx T$ . But **not always** ...

# Numerical experiment

---

- ▶ We vary the length of the ligament:

# Numerical experiment

---

- ▶ For one particular length of the ligament, we get a **standing mode** (zero transmission):

# Asymptotic analysis

To understand the phenomenon, we compute an **asymptotic expansion** of  $u_+^\varepsilon$ ,  $R_+^\varepsilon$ ,  $T^\varepsilon$  as  $\varepsilon \rightarrow 0$ .

$$(\mathcal{P}^\varepsilon) \left| \begin{array}{l} \Delta u_+^\varepsilon + k^2 u_+^\varepsilon = 0 \quad \text{in } \Omega^\varepsilon, \\ \partial_n u_+^\varepsilon = 0 \quad \text{on } \partial\Omega^\varepsilon \end{array} \right.$$

$$u_+^\varepsilon = \left| \begin{array}{l} e^{ikx} + R_+^\varepsilon e^{-ikx} + \dots \\ T^\varepsilon e^{+ikx} + \dots \end{array} \right.$$

► To proceed we use techniques of **matched asymptotic expansions** (see Beale 73, Gadyl'shin 93, Kozlov et al. 94, Nazarov 96, Maz'ya et al. 00, Joly & Tordeux 06, Lin & Zhang 17, 18, Brandao, Holley, Schnitzer 20, ...).

# Asymptotic analysis

---

- ▶ We work with the **outer expansions**

$$u_+^\varepsilon(x, y) = u^0(x, y) + \dots \quad \text{in } \Omega,$$

$$u_+^\varepsilon(x, y) = \varepsilon^{-1}v^{-1}(y) + v^0(y) + \dots \quad \text{in the resonator.}$$

- ▶ Considering the restriction of  $(\mathcal{P}^\varepsilon)$  to the thin resonator, when  $\varepsilon$  tends to zero, we find that  $v^{-1}$  must solve the homogeneous **1D** problem

$$(\mathcal{P}_{1D}) \left| \begin{array}{l} \partial_y^2 v + k^2 v = 0 \quad \text{in } (1; 1 + \ell) \\ v(1) = \partial_y v(1 + \ell) = 0. \end{array} \right.$$

# Asymptotic analysis

---

- ▶ We work with the **outer expansions**

$$u_+^\varepsilon(x, y) = u^0(x, y) + \dots \quad \text{in } \Omega,$$

$$u_+^\varepsilon(x, y) = \varepsilon^{-1}v^{-1}(y) + v^0(y) + \dots \quad \text{in the resonator.}$$

- ▶ Considering the restriction of  $(\mathcal{P}^\varepsilon)$  to the thin resonator, when  $\varepsilon$  tends to zero, we find that  $v^{-1}$  must solve the homogeneous **1D** problem

$$(\mathcal{P}_{1D}) \left| \begin{array}{l} \partial_y^2 v + k^2 v = 0 \quad \text{in } (1; 1 + \ell) \\ v(1) = \partial_y v(1 + \ell) = 0. \end{array} \right.$$

The features of  $(\mathcal{P}_{1D})$  play a key role in the **physical phenomena** and in the **asymptotic analysis**.

# Asymptotic analysis

- ▶ We work with the **outer expansions**

$$u_+^\varepsilon(x, y) = u^0(x, y) + \dots \quad \text{in } \Omega,$$

$$u_+^\varepsilon(x, y) = \varepsilon^{-1}v^{-1}(y) + v^0(y) + \dots \quad \text{in the resonator.}$$

- ▶ Considering the restriction of  $(\mathcal{P}^\varepsilon)$  to the thin resonator, when  $\varepsilon$  tends to zero, we find that  $v^{-1}$  must solve the homogeneous **1D** problem

$$(\mathcal{P}_{1D}) \left| \begin{array}{l} \partial_y^2 v + k^2 v = 0 \quad \text{in } (1; 1 + \ell) \\ v(1) = \partial_y v(1 + \ell) = 0. \end{array} \right.$$

The features of  $(\mathcal{P}_{1D})$  play a key role in the **physical phenomena** and in the **asymptotic analysis**.

- ▶ We denote by  $\ell_{\text{res}}$  (**resonance lengths**) the values of  $\ell$ , given by

$$\ell_{\text{res}} := \pi(m + 1/2)/k, \quad m \in \mathbb{N},$$

such that  $(\mathcal{P}_{1D})$  admits the **non zero** solution  $v(y) = \sin(k(y - 1))$ .

## Asymptotic analysis – Non resonant case

---

- Assume that  $\ell \neq \ell_{\text{res}}$ . Then we find  $v^{-1} = 0$  and when  $\varepsilon \rightarrow 0$ , we get

$$u_{\pm}^{\varepsilon}(x, y) = u_{\pm} + o(1) \quad \text{in } \Omega,$$

$$u_{\pm}^{\varepsilon}(x, y) = u_{\pm}(A) v_0(y) + o(1) \quad \text{in the resonator,}$$

$$R_{\pm}^{\varepsilon} = R_{\pm} + o(1), \quad T^{\varepsilon} = T + o(1).$$

Here  $v_0(y) = \cos(k(y-1)) + \tan(k(y-\ell)) \sin(k(y-1))$ .

## Asymptotic analysis – Non resonant case

- Assume that  $\ell \neq \ell_{\text{res}}$ . Then we find  $v^{-1} = 0$  and when  $\varepsilon \rightarrow 0$ , we get

$$u_{\pm}^{\varepsilon}(x, y) = u_{\pm} + o(1) \quad \text{in } \Omega,$$

$$u_{\pm}^{\varepsilon}(x, y) = u_{\pm}(A) v_0(y) + o(1) \quad \text{in the resonator,}$$

$$R_{\pm}^{\varepsilon} = R_{\pm} + o(1), \quad T^{\varepsilon} = T + o(1).$$

Here  $v_0(y) = \cos(k(y-1)) + \tan(k(y-\ell)) \sin(k(y-1))$ .

The thin resonator **has no influence at order  $\varepsilon^0$** .

→ **Not interesting for our purpose** because we want  $\left| \begin{array}{l} R_{\pm}^{\varepsilon} = 0 + \dots \\ T^{\varepsilon} = 1 + \dots \end{array} \right.$

# Asymptotic analysis – Resonant case

► For  $\ell = \ell_{\text{res}}$ , when  $\varepsilon \rightarrow 0$ , we obtain

$$u_+^\varepsilon(x, y) = u_+(x, y) + ak\gamma(x, y) + o(1) \quad \text{in } \Omega,$$

$$u_+^\varepsilon(x, y) = \varepsilon^{-1}a \sin(k(y-1)) + O(1) \quad \text{in the resonator,}$$

$$R_+^\varepsilon = R_+ + iau_+(A)/2 + o(1), \quad T^\varepsilon = T + iau_-(A)/2 + o(1).$$

Here  $\gamma$  is the outgoing **Green function** such that  $\left\{ \begin{array}{l} \Delta\gamma + k^2\gamma = 0 \text{ in } \Omega \\ \partial_n\gamma = \delta_A \text{ on } \partial\Omega \end{array} \right.$  and

$$ak = -\frac{u_+(A)}{\Gamma + \pi^{-1} \ln |\varepsilon| + C_\Xi}.$$

# Asymptotic analysis – Resonant case

► For  $\ell = \ell_{\text{res}}$ , when  $\varepsilon \rightarrow 0$ , we obtain

$$u_+^\varepsilon(x, y) = u_+(x, y) + ak\gamma(x, y) + o(1) \quad \text{in } \Omega,$$

$$u_+^\varepsilon(x, y) = \varepsilon^{-1}a \sin(k(y-1)) + O(1) \quad \text{in the resonator,}$$

$$R_+^\varepsilon = R_+ + iau_+(A)/2 + o(1), \quad T^\varepsilon = T + iau_-(A)/2 + o(1).$$

Here  $\gamma$  is the outgoing **Green function** such that  $\left. \begin{array}{l} \Delta\gamma + k^2\gamma = 0 \text{ in } \Omega \\ \partial_n\gamma = \delta_A \text{ on } \partial\Omega \end{array} \right\}$  and

$$ak = -\frac{u_+(A)}{\Gamma + \pi^{-1} \ln |\varepsilon| + C_\Xi}.$$

This time the thin resonator **has an influence at order  $\varepsilon^0$**

# Asymptotic analysis – Resonant case

- For  $\ell = \ell_{\text{res}} + \varepsilon\eta$  with  $\eta \in \mathbb{R}$  fixed, when  $\varepsilon \rightarrow 0$ , we obtain

$$u_+^\varepsilon(x, y) = u_+(x, y) + a(\eta)k\gamma(x, y) + o(1) \quad \text{in } \Omega,$$

$$u_+^\varepsilon(x, y) = \varepsilon^{-1}a(\eta) \sin(k(y-1)) + O(1) \quad \text{in the resonator,}$$

$$R_+^\varepsilon = R_+ + ia(\eta)u_+(A)/2 + o(1), \quad T^\varepsilon = T + ia(\eta)u_-(A)/2 + o(1).$$

Here  $\gamma$  is the outgoing **Green function** such that  $\left. \begin{array}{l} \Delta\gamma + k^2\gamma = 0 \text{ in } \Omega \\ \partial_n\gamma = \delta_A \text{ on } \partial\Omega \end{array} \right\}$  and

$$a(\eta)k = -\frac{u_+(A)}{\Gamma + \pi^{-1} \ln |\varepsilon| + C_\Xi + \eta}.$$

# Asymptotic analysis – Resonant case

► For  $\ell = \ell_{\text{res}} + \varepsilon\eta$  with  $\eta \in \mathbb{R}$  fixed, when  $\varepsilon \rightarrow 0$ , we obtain

$$u_+^\varepsilon(x, y) = u_+(x, y) + a(\eta)k\gamma(x, y) + o(1) \quad \text{in } \Omega,$$

$$u_+^\varepsilon(x, y) = \varepsilon^{-1}a(\eta) \sin(k(y-1)) + O(1) \quad \text{in the resonator,}$$

$$R_+^\varepsilon = R_+ + ia(\eta)u_+(A)/2 + o(1), \quad T^\varepsilon = T + ia(\eta)u_-(A)/2 + o(1).$$

Here  $\gamma$  is the outgoing **Green function** such that  $\left. \begin{array}{l} \Delta\gamma + k^2\gamma = 0 \text{ in } \Omega \\ \partial_n\gamma = \delta_A \text{ on } \partial\Omega \end{array} \right\}$  and

$$a(\eta)k = -\frac{u_+(A)}{\Gamma + \pi^{-1} \ln |\varepsilon| + C_\Xi + \eta}.$$

This time the thin resonator **has an influence at order  $\varepsilon^0$**  and it depends on the choice of  $\eta$ !

## Almost zero reflection

---

From this expansion, we find that asymptotically, when the length of the resonator is perturbed **around**  $\ell_{\text{res}}$ ,  $R_+^\varepsilon$ ,  $T^\varepsilon$  run on **circles** whose **features depend on the choice for  $A$** .

# Almost zero reflection

From this expansion, we find that asymptotically, when the length of the resonator is perturbed **around**  $\ell_{\text{res}}, R_+^\varepsilon, T^\varepsilon$  run on **circles** whose **features depend on the choice for  $A$** .

- ▶ Using the expansions of  $u_\pm(A)$  far from the obstacle, one shows:

**PROPOSITION:** There are **positions of the resonator  $A$**  such that the circle  $\{R_+^0(\eta) \mid \eta \in \mathbb{R}\}$  passes **through zero**.

# Almost zero reflection

From this expansion, we find that asymptotically, when the length of the resonator is perturbed **around**  $\ell_{\text{res}}, R_+^\varepsilon, T^\varepsilon$  run on **circles** whose **features depend on the choice for  $A$** .

- Using the expansions of  $u_\pm(A)$  far from the obstacle, one shows:

**PROPOSITION:** There are **positions of the resonator  $A$**  such that the circle  $\{R_+^0(\eta) \mid \eta \in \mathbb{R}\}$  passes **through zero**.  $\Rightarrow \exists$  situations s.t.  $R_+^\varepsilon = 0 + o(1)$ .

# Almost zero reflection

- ▶ Example of situation where we have almost zero reflection ( $\varepsilon = 0.3$ ).

*Simulations realized with the Freefem++ library.*

# Almost zero reflection

- ▶ Example of situation where we have almost zero reflection ( $\varepsilon = 0.01$ ).

*Simulations realized with the Freefem++ library.*

# Almost zero reflection

- Example of situation where we have **almost zero reflection** ( $\varepsilon = 0.01$ ).

*Simulations realized with the **Freefem++** library.*

**Conservation of energy** guarantees that when  $R_+^\varepsilon = 0$ ,  $|T^\varepsilon| = 1$ .  
→ To cloak the object, it remains to compensate the **phase shift!**

# Phase shifter

---

- ▶ Working with **two resonators**, we can create **phase shifters**, that is devices with **almost zero reflection** and any **desired phase**.

- ▶ Here the device is designed to obtain a **phase shift** approx. equal to  $\pi/4$ .

# Cloaking with three resonators

► Now working in two steps, we can approximately cloak any object with **three resonators**:

- 1) With one resonant ligament, first we get almost zero reflection;
- 2) With two additional resonant ligaments, we compensate the phase shift.

$\Re u_+$

$\Re u_+^\varepsilon$

$\Re (u_+^\varepsilon - e^{ikx})$

# Cloaking with two resonators

---

- ▶ Working a bit more, one can show that **two resonators** are enough to cloak any object.

$$t \mapsto \Re e (u_+(x, y) e^{-ikt})$$

$$t \mapsto \Re e (u_+^\varepsilon(x, y) e^{-ikt})$$

$$t \mapsto \Re e (e^{ik(x-t)})$$

# Outline of the talk

---

We present **two different** points of view on these questions of invisibility:

## 1 Cloaking of obstacles

### ASYMPTOTIC ANALYSIS:

$k$  and  $\Omega$  are given, we explain how to **perturb the geometry** using **thin resonant ligaments** to get  $T \approx 1$ .

## 2 A spectral approach to determine non reflecting wavenumbers

### SPECTRAL THEORY:

$\Omega$  is given, we explain how to **find non reflecting  $k$**  by solving an **unusual spectral problem**.

# Scattering problem

---

- Consider the scattering problem with  $k \in ((N-1)\pi; N\pi)$ ,  $N \in \mathbb{N}^*$

Find  $v = v_i + v_s$  s. t.

$$\Delta v + k^2 v = 0 \quad \text{in } \Omega,$$

$$\partial_n v = 0 \quad \text{on } \partial\Omega,$$

$v_s$  is outgoing.

# Scattering problem

- Consider the scattering problem with  $k \in ((N-1)\pi; N\pi)$ ,  $N \in \mathbb{N}^*$

Find  $v = v_i + v_s$  s. t.

$$\begin{aligned} \Delta v + k^2 v &= 0 && \text{in } \Omega, \\ \partial_n v &= 0 && \text{on } \partial\Omega, \\ v_s &&& \text{is outgoing.} \end{aligned}$$

- For this problem, the **modes** are

Propagating		$w_n^\pm(x, y) = e^{\pm i\beta_n x} \cos(n\pi y)$ , $\beta_n = \sqrt{k^2 - n^2\pi^2}$ , $n \in \llbracket 0, N-1 \rrbracket$
Evanescent		$w_n^\pm(x, y) = e^{\mp \beta_n x} \cos(n\pi y)$ , $\beta_n = \sqrt{n^2\pi^2 - k^2}$ , $n \geq N$ .

# Scattering problem

- Consider the scattering problem with  $k \in ((N-1)\pi; N\pi)$ ,  $N \in \mathbb{N}^*$

$$\begin{aligned} & \text{Find } v = v_i + v_s \text{ s. t.} \\ & \Delta v + k^2 v = 0 \quad \text{in } \Omega, \\ & \partial_n v = 0 \quad \text{on } \partial\Omega, \\ & v_s \text{ is outgoing.} \end{aligned}$$

- For this problem, the **modes** are

$$\begin{array}{l} \text{Propagating} \\ \text{Evanescent} \end{array} \left| \begin{array}{l} w_n^\pm(x, y) = e^{\pm i\beta_n x} \cos(n\pi y), \quad \beta_n = \sqrt{k^2 - n^2\pi^2}, \quad n \in \llbracket 0, N-1 \rrbracket \\ w_n^\pm(x, y) = e^{\mp \beta_n x} \cos(n\pi y), \quad \beta_n = \sqrt{n^2\pi^2 - k^2}, \quad n \geq N. \end{array} \right.$$

- Set  $v_i = \sum_{n=0}^{N-1} \alpha_n w_n^+$  for some given  $(\alpha_n)_{n=0}^{N-1} \in \mathbb{C}^N$ .

# Scattering problem

- Consider the scattering problem with  $k \in ((N-1)\pi; N\pi)$ ,  $N \in \mathbb{N}^*$

$$\left\{ \begin{array}{l} \text{Find } v = v_i + v_s \text{ s. t.} \\ \Delta v + k^2 v = 0 \quad \text{in } \Omega, \\ \partial_n v = 0 \quad \text{on } \partial\Omega, \\ v_s \text{ is outgoing.} \end{array} \right.$$

- For this problem, the **modes** are

$$\begin{array}{l} \text{Propagating} \\ \text{Evanescent} \end{array} \left\{ \begin{array}{l} w_n^\pm(x, y) = e^{\pm i\beta_n x} \cos(n\pi y), \quad \beta_n = \sqrt{k^2 - n^2\pi^2}, \quad n \in \llbracket 0, N-1 \rrbracket \\ w_n^\pm(x, y) = e^{\mp \beta_n x} \cos(n\pi y), \quad \beta_n = \sqrt{n^2\pi^2 - k^2}, \quad n \geq N. \end{array} \right.$$

- Set  $v_i = \sum_{n=0}^{N-1} \alpha_n w_n^+$  for some given  $(\alpha_n)_{n=0}^{N-1} \in \mathbb{C}^N$ .

- $v_s$  is outgoing  $\Leftrightarrow$

$$v_s = \sum_{n=0}^{+\infty} \gamma_n^\pm w_n^\pm \quad \text{for } \pm x \geq L, \text{ with } (\gamma_n^\pm) \in \mathbb{C}^{\mathbb{N}}.$$

# Goal of the section

---

DEFINITION:  $v$  is a non reflecting mode if  $v_s$  is expo. decaying for  $x \leq -L$   
 $\Leftrightarrow \gamma_n^- = 0, n \in \llbracket 0, N - 1 \rrbracket \Leftrightarrow$  energy is completely transmitted.

## GOAL

For a given geometry, we present a method to find values of  $k$  such that there is a non reflecting mode  $v$ .

## Goal of the section

---

DEFINITION:  $v$  is a **non reflecting mode** if  $v_s$  is **expo. decaying** for  $x \leq -L$   
 $\Leftrightarrow \gamma_n^- = 0, n \in \llbracket 0, N - 1 \rrbracket \Leftrightarrow$  **energy is completely transmitted.**

### GOAL

For a **given geometry**, we present a method to find **values of  $k$**  such that there is a **non reflecting mode**  $v$ .

→ Note that **non reflection** occurs for **particular  $v_i$**  to be computed.

REMINDER: 
$$v_s = \sum_{n=0}^{N-1} \gamma_n^\pm e^{\pm i\beta_n x} \cos(n\pi y) + \sum_{n=N}^{+\infty} \gamma_n^\pm e^{\mp \beta_n x} \cos(n\pi y), \quad \pm x \geq L.$$

Modal exponents for  $v_s$  ( $x \leq -L$ )

REMINDER: 
$$v_s = \sum_{n=0}^{N-1} \gamma_n^\pm e^{\pm i\beta_n x} \cos(n\pi y) + \sum_{n=N}^{+\infty} \gamma_n^\pm e^{\mp \beta_n x} \cos(n\pi y), \quad \pm x \geq L.$$

Modal exponents for  $v_s$  ( $x \leq -L$ )

- ▶ For  $\theta \in (0; \pi/2)$ , consider the **complex change of variables** (Aguilar, Combes 73)

$$\mathcal{I}_\theta(x) = \begin{cases} -L + (x + L) e^{i\theta} & \text{for } x \leq -L \\ x & \text{for } |x| < L \\ +L + (x - L) e^{i\theta} & \text{for } x \geq L. \end{cases}$$

REMINDER: 
$$v_s = \sum_{n=0}^{N-1} \gamma_n^\pm e^{\pm i\beta_n x} \cos(n\pi y) + \sum_{n=N}^{+\infty} \gamma_n^\pm e^{\mp \beta_n x} \cos(n\pi y), \quad \pm x \geq L.$$

Modal exponents for  $v_s$  ( $x \leq -L$ )

- ▶ For  $\theta \in (0; \pi/2)$ , consider the **complex change of variables** (Aguilar, Combes 73)

$$\mathcal{I}_\theta(x) = \begin{cases} -L + (x + L) e^{i\theta} & \text{for } x \leq -L \\ x & \text{for } |x| < L \\ +L + (x - L) e^{i\theta} & \text{for } x \geq L. \end{cases}$$

- ▶ Set  $v_\theta := v_s \circ (\mathcal{I}_\theta(x), y)$ .

- 1)  $v_\theta = v_s$  for  $|x| < L$ .
- 2)  $v_\theta$  is exp. decaying at infinity.

REMINDER: 
$$v_s = \sum_{n=0}^{N-1} \gamma_n^\pm e^{\pm i\beta_n x} \cos(n\pi y) + \sum_{n=N}^{+\infty} \gamma_n^\pm e^{\mp \beta_n x} \cos(n\pi y), \quad \pm x \geq L.$$

Modal exponents for  $v_s$  ( $x \leq -L$ )

$$v_\theta = \sum_{n=0}^{N-1} \tilde{\gamma}_n^\pm e^{\pm i\tilde{\beta}_n x} \cos(n\pi y) + \sum_{n=N}^{+\infty} \tilde{\gamma}_n^\pm e^{\mp \tilde{\beta}_n x} \cos(n\pi y), \quad \pm x \geq L \quad \tilde{\beta}_n = \beta_n e^{i\theta}$$

► Set  $v_\theta := v_s \circ (\mathcal{I}_\theta(x), y)$ .

- 1)  $v_\theta = v_s$  for  $|x| < L$ .
- 2)  $v_\theta$  is exp. decaying at infinity.

REMINDER: 
$$v_s = \sum_{n=0}^{N-1} \gamma_n^\pm e^{\pm i\beta_n x} \cos(n\pi y) + \sum_{n=N}^{+\infty} \gamma_n^\pm e^{\mp \beta_n x} \cos(n\pi y), \quad \pm x \geq L.$$

Modal exponents for  $v_s$  ( $x \leq -L$ )

Modal exponents for  $v_\theta$  ( $x \leq -L$ )

$$v_\theta = \sum_{n=0}^{N-1} \tilde{\gamma}_n^\pm e^{\pm i\tilde{\beta}_n x} \cos(n\pi y) + \sum_{n=N}^{+\infty} \tilde{\gamma}_n^\pm e^{\mp \tilde{\beta}_n x} \cos(n\pi y), \quad \pm x \geq L \quad \tilde{\beta}_n = \beta_n e^{i\theta}$$

► Set  $v_\theta := v_s \circ (\mathcal{I}_\theta(x), y)$ .

- 1)  $v_\theta = v_s$  for  $|x| < L$ .
- 2)  $v_\theta$  is exp. decaying at infinity.

►  $v_\theta$  solves

$$(*) \quad \left\{ \begin{array}{l} \alpha_\theta \frac{\partial}{\partial x} \left( \alpha_\theta \frac{\partial v_\theta}{\partial x} \right) + \frac{\partial^2 v_\theta}{\partial y^2} + k^2 v_\theta = 0 \quad \text{in } \Omega \\ \partial_n v_\theta = -\partial_n v_i \quad \text{on } \partial\Omega. \end{array} \right.$$

►  $v_\theta$  solves

$$(*) \quad \left\{ \begin{array}{l} \alpha_\theta \frac{\partial}{\partial x} \left( \alpha_\theta \frac{\partial v_\theta}{\partial x} \right) + \frac{\partial^2 v_\theta}{\partial y^2} + k^2 v_\theta = 0 \quad \text{in } \Omega \\ \partial_n v_\theta = -\partial_n v_i \quad \text{on } \partial\Omega. \end{array} \right.$$
$$\alpha_\theta(x) = 1 \text{ for } |x| < L \quad \alpha_\theta(x) = e^{-i\theta} \text{ for } |x| \geq L$$

►  $v_\theta$  solves (\*)

$$\left. \begin{aligned} \alpha_\theta \frac{\partial}{\partial x} \left( \alpha_\theta \frac{\partial v_\theta}{\partial x} \right) + \frac{\partial^2 v_\theta}{\partial y^2} + k^2 v_\theta &= 0 && \text{in } \Omega \\ \partial_n v_\theta &= -\partial_n v_i && \text{on } \partial\Omega. \end{aligned} \right\}$$

$$\alpha_\theta(x) = 1 \text{ for } |x| < L \quad \alpha_\theta(x) = e^{-i\theta} \text{ for } |x| \geq L$$

- Numerically we solve (\*) in the truncated domain

⇒ We obtain a good approximation of  $v_s$  for  $|x| < L$ .

- This is the method of **Perfectly Matched Layers** (PMLs), **Berenger 94**.

# Spectral analysis

- Define the operators  $A$ ,  $A_\theta$  of  $L^2(\Omega)$  such that

$$Av = -\Delta v, \quad A_\theta v = -\left(\alpha_\theta \frac{\partial}{\partial x} \left(\alpha_\theta \frac{\partial v}{\partial x}\right) + \frac{\partial^2 v}{\partial y^2}\right) + \partial_n v = 0 \text{ on } \partial\Omega.$$

- $A$  is selfadjoint and positive.
- $\sigma(A) = \sigma_{\text{ess}}(A) = [0; +\infty)$ .
- $\sigma(A)$  may contain **embedded eigenvalues** in the essential spectrum.

- ess. spectrum
- embedded eig.

- $A_\theta$  is not selfadjoint.  $\sigma(A_\theta) \subset \{\rho e^{i\gamma}, \rho \geq 0, \gamma \in [-2\theta; 0]\}$ .
- $\sigma_{\text{ess}}(A_\theta) = \cup_{n \in \mathbb{N}} \{n^2 \pi^2 + t e^{-2i\theta}, t \geq 0\}$ .
- **real eigenvalues** of  $A_\theta =$  **real eigenvalues** of  $A$ .

- ess. spectrum
- embedded eig.
- complex res.

→ A compact perturbation can change drastically the spectrum ( $B_\theta$  is **not selfadjoint**).

**Numerical consequences?**

# Numerical results

---

- ▶ Again we work in the geometry

- ▶ Define the operators  $\mathcal{P}$  (Parity),  $\mathcal{T}$  (Time reversal) such that

$$\mathcal{P}v(x, y) = v(-x, y) \quad \text{and} \quad \mathcal{T}v(x, y) = \overline{v(x, y)}.$$

PROP.: For **symmetric**  $\Omega = \{(-x, y) \mid (x, y) \in \Omega\}$ ,  $B_\theta$  is  $\mathcal{PT}$  symmetric:

$$\mathcal{PT}B_\theta\mathcal{PT} = B_\theta.$$

As a consequence,  $\sigma(B_\theta) = \overline{\sigma(B_\theta)}$ .

$\Rightarrow$  If  $\lambda$  is an “**isolated**” eigenvalue located **close to the real axis**, then  **$\lambda \in \mathbb{R}$** !

# Numerical results

- **Discretized** spectrum in  $k$  (not in  $k^2$ ). We take  $\theta = \pi/4$ .

# Numerical results

- ▶ **Discretized** spectrum in  $k$  (not in  $k^2$ ). We take  $\theta = \pi/4$ .

# Numerical results

- **Discretized** spectrum in  $k$  (not in  $k^2$ ). We take  $\theta = \pi/4$ .

# Numerical results

---

- ▶ We display the eigenmodes for the **ten first real eigenvalues** in the whole computational domain (including PMLs).

# Numerical results

---

- Let us focus on the eigenmodes such that  $0 < k < \pi$ .

First trapped mode

$$k = 1.2355\dots$$

Second trapped mode

$$k = 2.3897\dots$$

First non reflecting mode

$$k = 1.4513\dots$$

Second non reflecting mode

$$k = 2.8896\dots$$

# Numerical results

- ▶ To check our results, we compute  $k \mapsto |R(k)|$  for  $0 < k < \pi$ .

First non reflecting mode

$$k = 1.4513\dots$$

Second non reflecting mode

$$k = 2.8896\dots$$

# Numerical results

- To check our results, we compute  $k \mapsto |R(k)|$  for  $0 < k < \pi$ .

First non reflecting mode

$$k = 1.4513\dots$$

Second non reflecting mode

$$k = 2.8896\dots$$

There is perfect agreement!

# Numerical results

---

- ▶ Now the geometry is **not symmetric** in  $x$  nor in  $y$ :

- ▶ The operator  $B_\theta$  is **no longer  $\mathcal{PT}$ -symmetric** and we expect:
  - No trapped modes
  - No invariance of the spectrum by complex conjugation.

# Numerical results

- **Discretized** spectrum of  $B_\theta$  in  $k$  (not in  $k^2$ ). We take  $\theta = \pi/4$ .

- Indeed, the spectrum is **not symmetric** w.r.t. the real axis.

# Numerical results

- We compute  $k \mapsto |R(k)|$  for  $0 < k < \pi$ .

$$k = 1.28 + 0.0003i$$

$$k = 2.3866 + 0.0005i$$

$$k = 2.8647 + 0.0243i$$

# Numerical results

- We compute  $k \mapsto |R(k)|$  for  $0 < k < \pi$ .

$$k = 1.28 + 0.0003i$$

$$k = 2.3866 + 0.0005i$$

$$k = 2.8647 + 0.0243i$$

**Complex eigenvalues** also contain information on **almost no reflection**.

# Outline of the talk

---

We present **two different** points of view on these questions of invisibility:

## 1 Cloaking of obstacles

### ASYMPTOTIC ANALYSIS:

$k$  and  $\Omega$  are given, we explain how to **perturb the geometry** using **thin resonant ligaments** to get  $T \approx 1$ .

## 2 A spectral approach to determine non reflecting wavenumbers

### SPECTRAL THEORY:

$\Omega$  is given, we explain how to **find non reflecting  $k$**  by solving an **unusual spectral problem**.

## Conclusion

### Part I

- ♠ Method to cloak any object in monomode regime using thin resonators. Two main ingredients:
  - Around resonant lengths, effects of order  $\varepsilon^0$  with perturb. of width  $\varepsilon$ .
  - Explicit dependence wrt to the geometry in the 1D limit resonator.
- 1) We can similarly hide penetrable obstacles or work in 3D.
- 2) We can do cloaking at a finite number of wavenumbers (thin structures are resonant at one wavenumber otherwise act at order  $\varepsilon$ ).
- 3) With Dirichlet BCs, other ideas must be found.

### Part II

- ♠ Spectral approach to compute non reflecting  $k$  ( $R = 0$ ) for a given  $\Omega$ .
- 1) Can we find a spectral approach to compute completely reflecting or completely invisible  $k$ ?
- 2) Can we prove existence of non reflecting  $k$  for the  $\mathcal{PT}$ -symmetric pb?
