

# Historical roots:

- Evolution Strategies (ESs):
  - developed by Rechenberg, Schwefel, etc. in 1960s.
  - focus: real-valued parameter optimization
  - individual: vector of real-valued parameters
  - reproduction: Gaussian "mutation" of parameters

2

4

– M parents, K>>M offspring

Historical roots:

- Evolutionary Programming (EP):
  - Developed by Fogel in 1960s
  - Goal: evolve intelligent behavior
  - Individuals: finite state machines
  - Offspring via mutation of FSMs
  - M parents, M offspring

Historical roots:

- Genetic Algorithms (GAs):
  - developed by Holland in 1960s
  - goal: robust, adaptive systems
  - used an internal "genetic" encoding of points
  - reproduction via mutation and recombination of the genetic code.
  - M parents, M offspring

# Present Status:

- wide variety of evolutionary algorithms (EAs)
- wide variety of applications
  - optimization
  - search
  - learning, adaptation
- well-developed analysis
  - theoretical
  - experimental

5

7

# **Interesting dilemma:**

- A bewildering variety of algorithms and approaches:
  - GAs, ESs, EP, GP, Genitor, CHC, messy GAs, ...
- Hard to see relationships, assess strengths & weaknesses, make choices, ...

6

A Personal Interest:

- Develop a general framework that:
  - Helps one compare and contrast approaches.
  - Encourages crossbreeding.
  - Facilitates intelligent design choices.

- Common features
- Basic definitions and terminology

# **Common Features:**

- Use of Darwinian-like <u>evolutionary</u> processes to solve difficult <u>computational</u> problems.
- Hence, the name:

#### **Evolutionary Computation**

10

- a notion of "inheritance"

11

An EA template:	
1. Randomly generate an initial population.	
2. Do until some stopping criteria is met:	
Select individuals to be parents (biased by fitness). Produce offspring. Select individuals to die (biased by fitness).	
End Do.	
3. Return a result.	
	12

# **Reproduction:**

- Preserve useful features
- Introduce variety and novelty
- Strategies:
  - single parent: cloning + mutation
  - multi-parent: recombination + mutation
- Price's theorem:
  - fitness covariance

# **Exploitation/Exploration Balance:**

- Selection pressure: exploitation
  - reduce scope of search
- Reproduction: exploration
  - expand scope of search
- Key issue: appropriate balance
  - e.g., strong selection + high mutation rates
  - e.g, weak selection + low mutation rates

19

# **Representation:**

- How to represent the space to be searched?
  - Genotypic representations:
    - universal encodings
    - portability
    - minimal domain knowledge

# **Fitness landscapes:**

- Continuous/discrete
- Number of local/global peaks
- Ruggedness
- Constraints
- Static/dynamic

# Intuitive view:

- parallel, adaptive search procedure.
- useful global search heuristic.
- a paradigm that can be instantiated in a variety of ways.
- can be very general or problem specific.
- strong sense of fitness "optimization".

25

# **Evolutionary Optimization:**

- fitness: function to be optimized
- individuals: points in the space
- reproduction: generating new sample points from existing ones.

#### 26

# **Useful Optimization Properties:**

- applicable to continuous, discrete, mixed optimization problems.
- no *a priori* assumptions about convexity, continuity, differentiability, etc.
- relatively insensitive to noise
- easy to parallelize

#### 27

# **Real-valued Param. Optimization:**

- high dimensional problems
- highly multi-modal problems
- problems with non-linear constraints

- TSP problems
- Boolean satisfiability problems
- Frequency assignment problems
- Job shop scheduling problems

29

31

# Multi-objective Optimization: • Pareto optimality problems • a variety of industrial problems

30

32

# **Properties of standard EAs:**

- GAs:
  - universality encourages new applications
  - well-balanced for global search
  - requires mapping to internal representation

# **Properties of standard EAs:**

- ESs:
  - well-suited for real-valued optimization.
  - built-in self-adaptation.
  - requires significant redesign for other application areas.

# **Properties of standard EAs:**

#### • **EP**:

- well-suited for phenotypic representations.
- encourages domain-specific representation and operators.
- requires significant design for each application area.

33

# **Other EAs:**

#### • GENITOR: (Whitley)

- "steady state" population dynamics
  - K=1 offspring
  - overlapping generations
- parent selection: ranking
- survival selection: ranking
- large population sizes
- high mutation rates

34

36

# **Other EAs:**

- GP: (Koza)
  - standard GA population dynamics
  - individuals: parse trees of Lisp code
  - large population sizes
  - specialized crossover
  - minimal mutation

# **Other EAs:**

- Messy GAs: (Goldberg)
  - Standard GA population dynamics
  - Adaptive binary representation
    - genes are position-independent

# **Other EAs:**

- GENOCOP: (Michalewicz)
  - Standard GA population dynamics
  - Specialized representation & operators for real valued constrained optimization problems.

37

# **Designing an EA:**

- Choose appropriate selection pressure - local vs. global search
- Choosing a useful fitness function
  - exploitable information

39

38

40

# Industrial Example: Evolving NLP Tagging Rules • Existing tagging engine

- Existing rule syntax
- Existing rule semantics
- Goal: improve
  - development time for new domains
  - tagging accuracy

# New developments and directions: Exploiting Morphogenesis: sophisticated genotype --> phenotype mappings evolve plans for building complex objects rather than the objects themselves.

49

### New developments and directions:

#### • Hybrid Systems:

- combine EAs with other techniques:
  - EAs and gradient methods
  - · EAs and TABU search
  - EAs and ANNs
  - EAs and symbolic machine learning

50

52

# New developments and directions:

- Time-varying environments:
  - fitness landscape changes during evolution
  - goal: adaptation, tracking
  - standard optimization-oriented EAs not wellsuited for this.

# New developments and directions:

- Agent-oriented problems:
  - individuals more autonomous, active
  - fitness a function of other agents and environment-altering actions
  - standard optimization-oriented EAs not wellsuited for this.

# **EA Generalizations:**

- Nature-Inspired Computation:
  - Early example: simulated annealing
  - Today: evolutionary algorithms
  - Others: particle swarm, ant colony, ...

54

# **Conclusions:**

- Powerful tool for your toolbox.
- Complements other techniques.
- Best viewed as a paradigm to be instantiated, guided by theory and practice.
- Success a function of particular instantiation.
