

About You

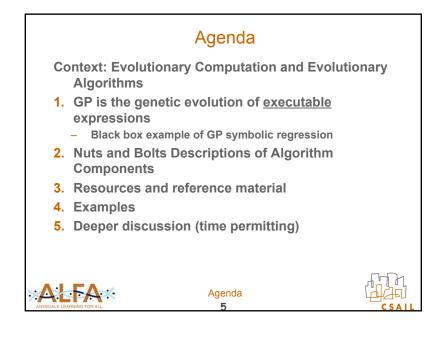

- EA experience?
 - ES? GA? EDA? PSO? ACO? EP?
- CS experience?
- Programming? algorithms?
- Teacher?
- Native English speakers?

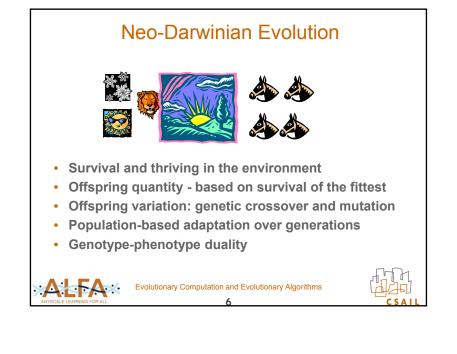

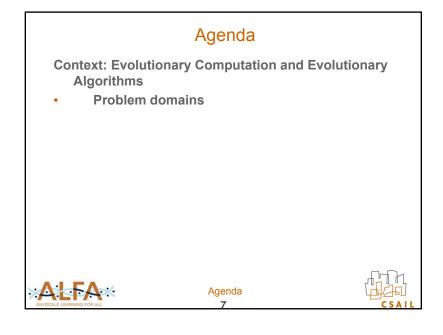

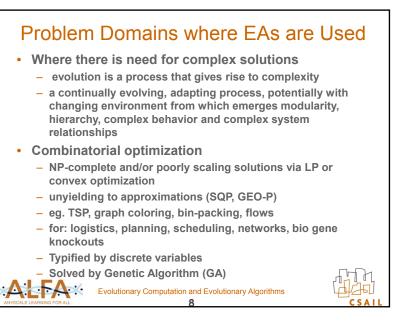

Tutorial Goals

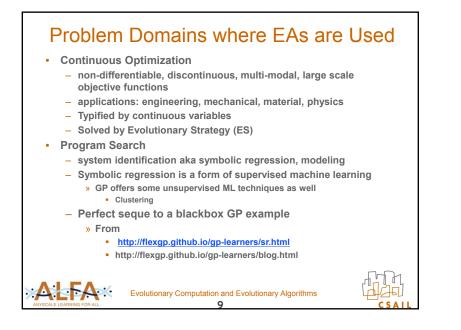

- Introduction to GP algorithm, given some knowledge
 of genetic algorithms or evolutionary strategies
 - Enable Black box demonstration of GP symbolic regression
- Become familiar with GP design properties and recognize them
- You could teach it in an undergrad lecture
- Try it "out of the box" with software libraries of others
- Set groundwork for advanced topics
 - Theory
 - Specialized workshops Symbolic Regression, bloat, etc
 - GP Track talks at GECCO, Proceedings of EuroGP, Genetic Programming and Evolvable Machines

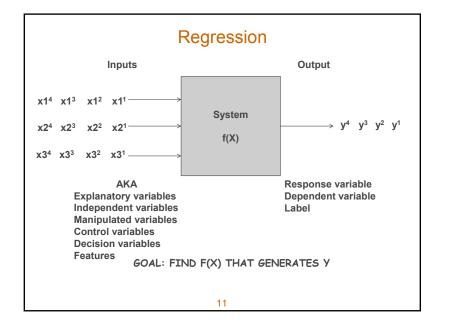

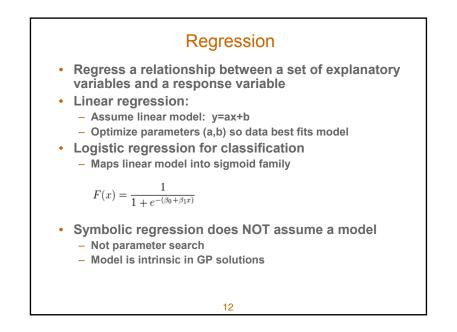

Blackbox Example of GP Symbolic Regression

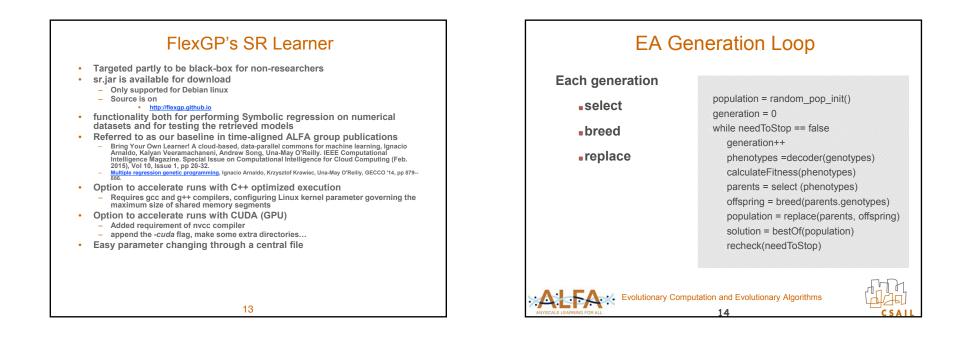

http://flexgp.github.io/gp-learners/sr.html http://flexgp.github.io/gp-learners/blog.html

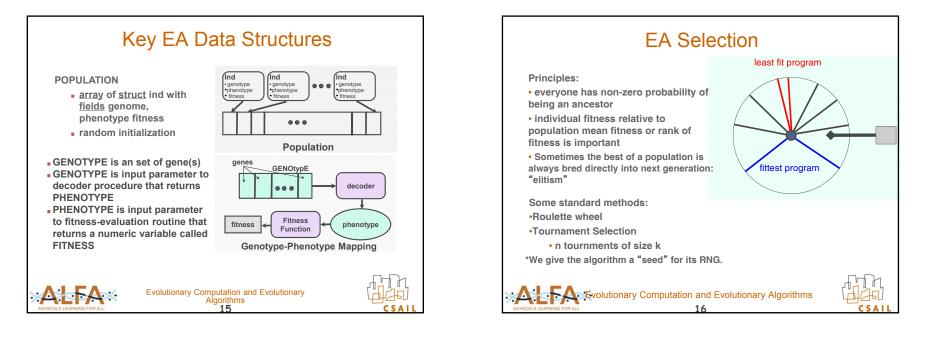

S/W by ALFA Group's FlexGP team Special recognition to Ignacio Arnaldo, PhD who prepared SR Learner tutorial and blog post

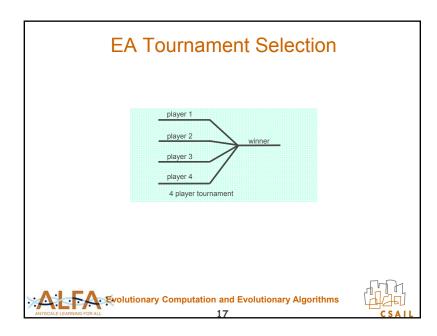

10

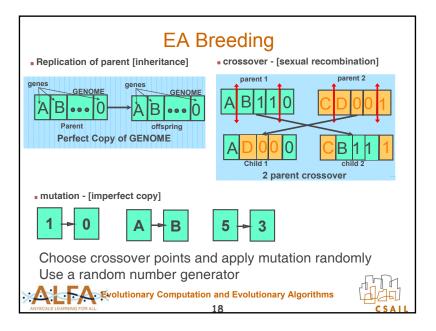

EA Replacement

Deterministic

- use best of parents and offspring to replace parents
- replace parents with offspring

Stochastic

- some sort of tournament or fitness proportional choice
- run a tournament with old pop and offspring
- run a tournament with parents and offspring

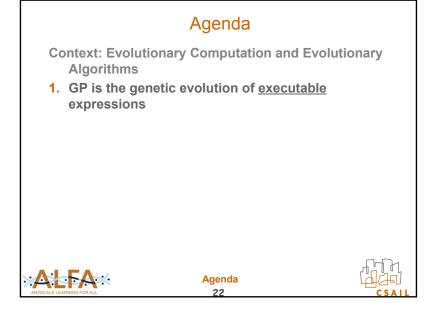

EA Pseudocode population.genotypes = random_pop_init()

birth population.phenotypes =decoder(population.genotypes) population.fitness= calculate_fitness(population.phenotypes)^{development} fitness for breeding generation = 0 generations while needToStop == false generation++ parents.genotypes = select (population.fitness) select offspring.genotypes = crossover_mutation(parents.genotypes) offspring.phenotypes =decoder(offspring.genotypes) offspring.fitness= calculate_fitness(offspring.phenotypes) ss for breeding population = replace(parents.fitness, offspring.fitness) replace refresh(needToStop)

Problem	Gene	Genome	Phenotype	Fitness Function
TSP	110	sequence of cities	tour	tour length
Function optimization	3.21	variables <u>x_of</u> function f(<u>x</u>)		min-f(<u>x</u>)
graph k-coloring	permutation element	sequence for greedy coloring # of unco		# of uncolored node
investment strategy	rule	agent rule set	trading strategy	portfolio change
Regress data	Executable sub- expression	Executable expression	model	Model error on training set (L1, L2

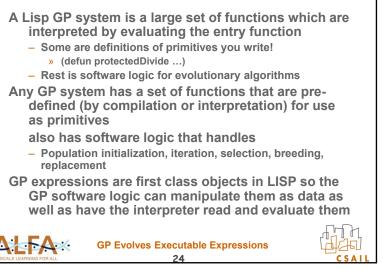

EA Individual Examples

Koza's Executable Expressions

 Pioneered circa 1988 Lisp S-Expressions Composed of primitiv called 'functions' and 'terminals' Aka operators and variables Example: primitives: + - * div a b c d 4 (*(- (+ 4 c) b) (div d a)) In a Lisp interpreter: bind a b c and d 	(set! c 6) -> 6 (set! d 8) -> 8 (*(- (+ 4 c) b) (div d a)) -> 12 ; Rule Example (if (= a b) c d) -> 8
2. Evaluate expression	is not
GP Evolves I	Executable Expressions

A Lisp GP system

SAI

Details When Using Executable Expressions

- Closure
 - Design functions with wrappers that accept any type of argument
 - Often types will semantically clash...need to have a way of dealing with this

Practicality

- Sufficiency
 - Make sure a solution can be plausibly expressed when choosing your primitive set
 - » Functions must be wisely chosen but not too complex
 - » General primitives: arithmetic, boolean, condition, iteration, assignment
 - » Problem specific primitives
 - Can you handcode a naïve solution?
 - Balance flexibility with search space size

GP Evolves Executable Expressions 26

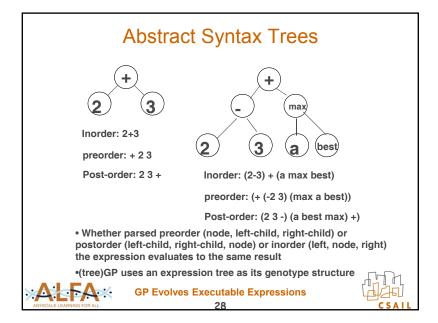

Expression Representation

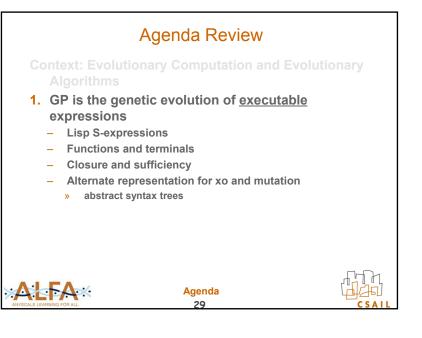

- · Printing, executing: nested list of symbols
 - 3+2
 - (+ 2 3) ; same as above, different syntax
 - (3 2 +) ; same too
- Crossover/Mutation:
 - GP needs to be able to crossover and mutate executable expressions, how?
 - Expressions can be represented universally by an abstract syntax via a tree

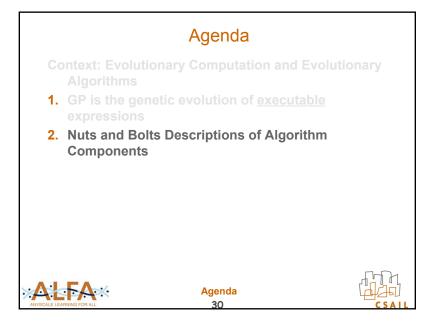

GP Evolves Executable Expressions 27

<section-header> Depundenci on presentation of the properties of the prop

Determining a Expression's Fitness

- One test case:
 - Execute the expression with the problem decision variables (ie terminals) bound to some test value and with side effect values initialized
 - Designate the "result" of the expression
- Measure the error between the correct output values for the inputs and the result of the expression
 - Final output may be side effect variables, or return value of expression
 - Eg. Examine expression result and expected result for regression
 - Eg. the heuristic in a compilation, run the binary with different inputs and measure how fast they ran.
 - EG, Configure a circuit from the genome, test the circuit with an input signal and measure response vs desired response
- Usually have more than one test case but cannot enumerate them all
 - Use rational design to create incrementally more difficult test cases (eg block stacking)
 - Use balanced data for regression

Things to Ensure to Evolve Programs

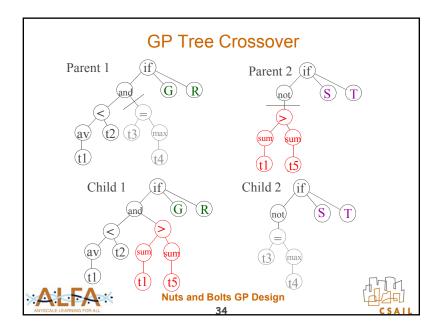

31

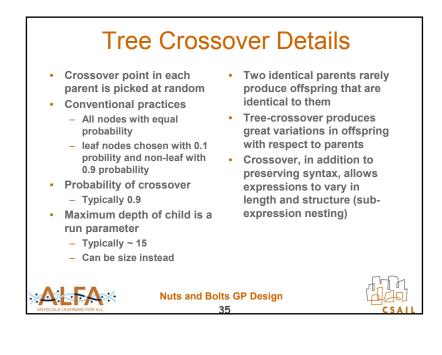

- Programs of varying length and structure must compose the search space
- Closure
- Crossover of the genotype must preserve syntactic correctness so the program can be directly executed

Nuts and Bolts GP Design

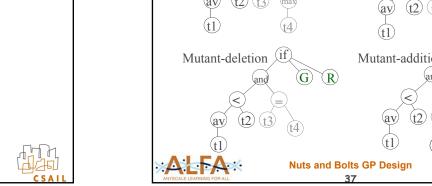

GP Tree Mutation

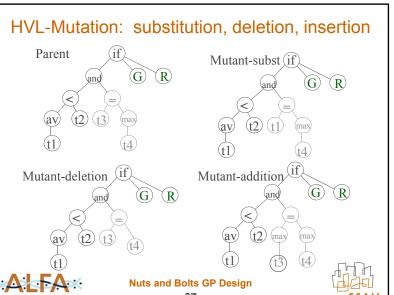

- Often only crossover is used •
- But crossover behaves often like macro-mutation •
- · Mutation can be better tuned to control the size of the change

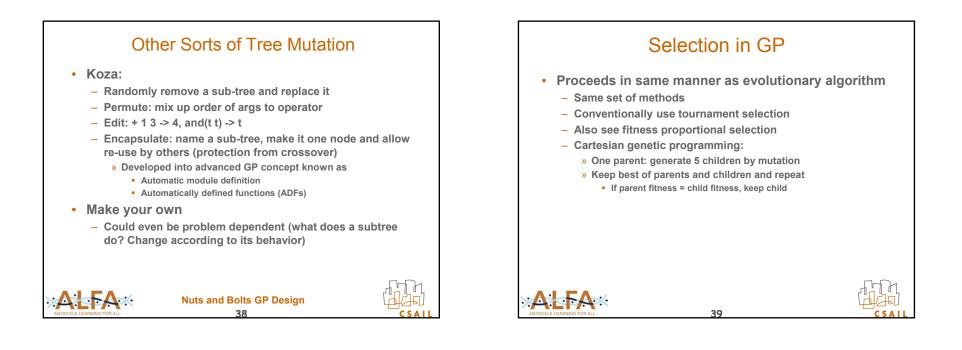

Nuts and Bolts GP Design

36

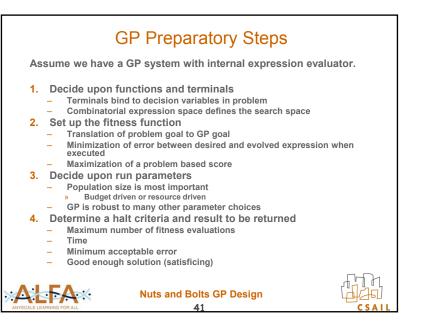

A few different versions

Agenda Checkpoint

Nuts and Bolts GP Design

- · How we create random GP expressions
- · How we create a diverse population of expressions
- A general procedure for fitness function design
- · How we mutate and crossover expressions
- Selection
- Put it together: one algorithm, at run level

ponyGP.js

- Javascript implementation
 - <u>https://github.com/hembergerik/EC-</u> <u>Stable/tree/master/pony_gp/javascript</u>
- Developed as part of ALFA's GP mooc curriculum initiative by Erik Hemberg, PhD.
- We will use Chrome's developer tool option to trace ponyGP
- We will use the webstorm IDE to examine the ponyGP.js data structures and code
- ponyGP.js performs simple symbolic regression

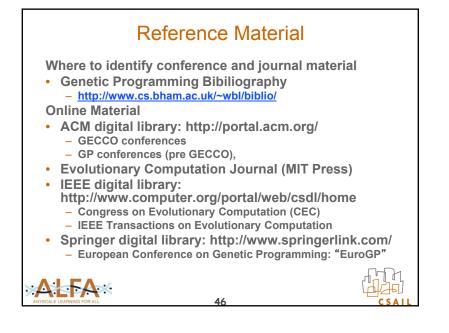

Agenda

Context: Evolutionary Computation and Evolutionary Algorithms

> Agenda 45

- 1. GP is the genetic evolution of <u>executable</u> expressions
- 2. Nuts and Bolts Descriptions of Algorithm Components
- 3. Resources and reference material

GP Software

Commonly used in published research (and somewhat active):

- Heuristic lab (using grammar guided GP) , GEVA (UCD)
- EPOCHx
- DEAP, JGAP
- Java: ECJ, TinyGP,
- Matlab: GPLab, GPTips
- C/C++: MicroGP
- Python: Ponygp, oop_ponyGP.py, DEAP, PyEvolve
- .Net: Aforge.NET
- http://flexgp.github.io/gp-learners/index.html
- Others
 - <u>http://www.epochx.org/index.php</u>
 Strongly typed GP, Grammatical evolution, etc
 Lawrence Beadle and Colin G Johnson

Block Stacking Fitness Cases

- different initial stack and table configurations (Koza - 166)
 - stack is correct but not complete
 - top of stack is incorrect and stack is incomplete
 - Stack is complete with incorrect blocks
- Each correct stack at end of expression evaluation scores 1 "hit"
- fitness is number of hits (out of 166)

Block Stacking Example 55

Evolved Solutions to Block Stacking

eq(do-until(to-table(top-block) (not top-block)) do-until(to-stack(next-needed) (not next-needed)

- first do-until removes all blocks from stack until it is empty and top-block returns nil
- second do-until puts blocks on stacks correctly until stack is correct and next-needed returns nil
- eg is irrelevant boolean test but acts as connective wasteful in movements whenever stack is correct
- · Add a fitness factor for number of block movements do-until(eq (do-until (to-table(top-block)

(eq top-block top-correct))

(do-until (to-stack(next-needed) (not next-needed)) (not next-needed)

- Moves top block of stack to table until stack is correct
- Moves next needed block from table to stack
- Eq is again a connective, outer do-until is harmless, no-op

Block Stacking Example

More Examples of Genetic Programming

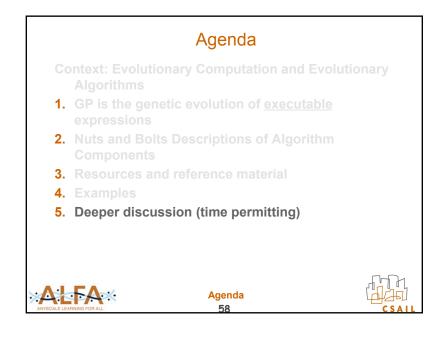

57

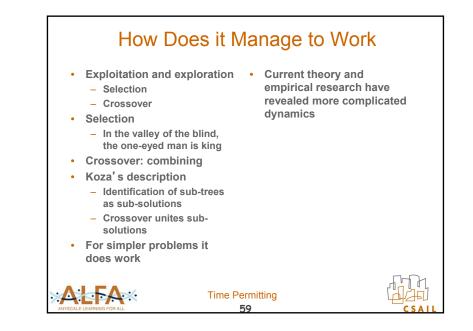

- Evolve priority functions that allow a compiler to heuristically choose between alternatives in hyper-block allocation
- Evolve a model that predicts, based on past market values, whether a stock's value will increase, decrease or stay the same
 - Measure-correlate-predict a wind resource
 - ICU clinical forecasting » FlexGP

 - Model each panelist
 - » Advanced methods for panelist clustering. bootstrapped flavor optimization
- Community Benchmarks
 - Artifical Ant
 - Boolean Multiplexor
- FlexGP
 - Cloud scale, flexibly factored and scaled GP

Why are we still here? **Issues and Challenges** Trees use up a lot of · Bloat: Solutions are full of sub-expressions that may memory never execute or that Trees take a long time execute and make no to execute difference - Change the language for Operator and operand sets expressions are so large, population is » C, Java so big, takes too long to run - Pre-compile the Runs "converge" to a nonexpressions, PDGP changing best fitness (Poli) - Store one big tree and - No progress in solution mark each pop member improvement before a good as part of it enough solution is found » Compute subtrees for different inputs, store and reuse **Time Permitting** 60

Runs "converge": Evolvability

- Is an expression tree ideal for evolvability?
- Trees do not align, not mixing likes with likes as we would do in genetic algorithm
- · Biologically this is called "non-homologous"
- One-point crossover
 - By Poli & Langdon
 - Theoretically a bit more tractable
 - Not commonly used
 - Still not same kind of genetic material being swapped

Time Permitting
