# John's perspective of hyperheuristics

25 April, 2018 John R. Woodward, Daniel R. Tauritz

#### Instructors

Daniel R. Tauritz is an Associate Professor and Associate Chair for Undergraduate Studies in the Department of Computer Science at the Missouri University of Science and Technology (S&T) a Contract Scientist for Los Alamos National Laboratory (LANL) and Sandia National Laboratories, the founding director of S&T's Natural Computation Laboratory, and founding academic director of the LANL/S&T Cyber Security Sciences Institute. He received his Ph.D. in 2002 from Leiden University. His research interests include the design of hyper-heursitists and self-configuring evolutionary algorithms and the application of computational intelligence techniques in cyber security, critical infrastructure protection, and program understanding.

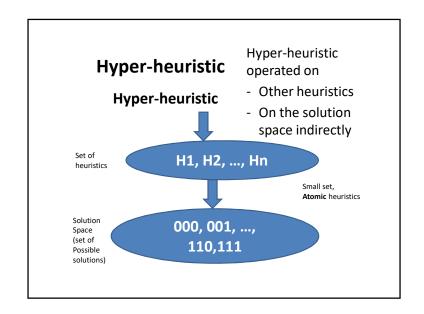

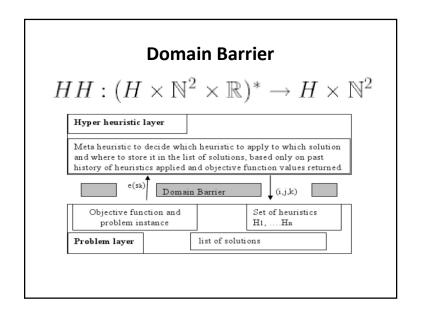

John R. Woodward is a Lecturer at the Queen Mary University of Londn and is employed on the DAASE project, and for the previous four years was a lecturer with the University of Nottingham. He holds a BSc in Theoretical Physics, an MSc in Cognitive Science and a PhD in Computer Science, all from the University of Birmingham. His research interests include Automated Software Engineering, particularly Search Based Software Engineering, Artificial Intelligence/Machine Learning and in particular Genetic Programming. He has worked in industrial, military, educational and academic settings, and been employed by EDS, CERN and RAF and three UK Universities.

# Metaheuristic (Meta)heuristic -Sample solutions -Generates solutions Space (set of Possible solutions) 000, 001, ..., 110,111

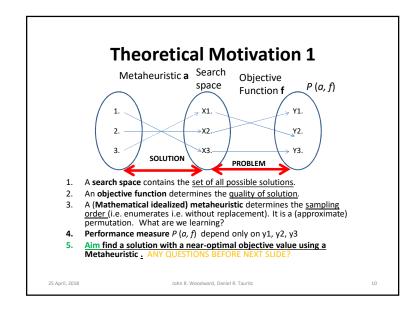

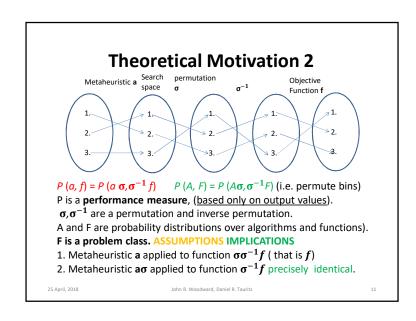

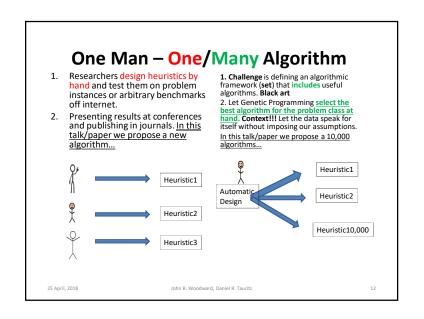

# Daniel's perspective of hyperheuristics

25 April, 2018

John R. Woodward, Daniel R. Tauritz

# **Automated Design of Algorithms**

- Addresses the need for custom algorithms
- But due to high computational complexity, only feasible for repeated problem solving
- Hyper-heuristics accomplish automated design of algorithms by searching program space

**Real-World Challenges** 

- Researchers strive to make algorithms increasingly general-purpose
- But practitioners have very specific needs
- Designing custom algorithms tuned to particular problem instance distributions and/or computational architectures can be very time consuming

25 April, 2018

John R. Woodward, Daniel R. Tauritz

### Hyper-heuristics

- Hyper-heuristics are a special type of meta-heuristic
  - Step 1: Extract algorithmic primitives from existing algorithms
  - Step 2: Search the space of programs defined by the extracted primitives
- While Genetic Programming (GP) is particularly well suited for executing Step 2, other meta-heuristics can be, and have been, employed
- The type of GP employed matters [24]

25 April, 2018

John R. Woodward, Daniel R. Tauritz

16

# Type of GP Matters: Experiment Description

- Implement five types of GP (tree GP, linear GP, canonical Cartesian GP, Stack GP, and Grammatical Evolution) in hyper-heuristics for evolving black-box search algorithms for solving 3-SAT
- Base hyper-heuristic fitness on the fitness of the best search algorithm generated at solving the 3-SAT problem
- Compare relative effectiveness of each GP type as a hyper-heuristic

### **GP Individual Description**

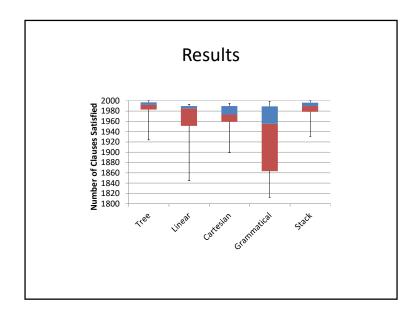

- Search algorithms are represented as an iterative algorithm that passes one or more set of variable assignments to the next iteration
- Genetic program represents a single program iteration
- Algorithm runs starting with a random initial population of solutions for 30 seconds

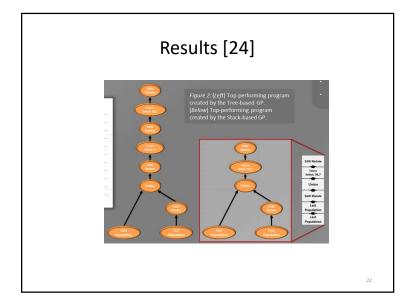

#### 3-SAT Problem

- A subset of the Boolean Satisfiability Problem (SAT)
- The goal is to select values for Boolean variables such that a given Boolean equation evaluates as true (is satisfied)
- Boolean equations are in 3-conjunctive normal form
- Example:
  - (A V B V C)  $\wedge$  (¬A V ¬C V D)  $\wedge$  (¬B V C V ¬D)
  - Satisfied by ¬A, B, C, ¬D
- Fitness is the number of clauses satisfied by the best solution in the final population

# **Genetic Programming Nodes Used**

- Last population, Random population
- Tournament selection, Fitness proportional selection, Truncation selection, Random selection
- Bitwise mutation, Greedy flip, Quick greedy flip, Stepwise adaption of weights, Novelty
- Union

#### Results

- Generated algorithms mostly performed comparably well on training and test problems
- Tree and stack GP perform similarly well on this problem, as do linear and Cartesian GP
- Tree and stack GP perform significantly better on this problem than linear and Cartesian GP, which perform significantly better than grammatical evolution

#### **Conclusions**

- The choice of GP type makes a significant difference in the performance of the hyper-heuristic
- The size of the search space appears to be a major factor in the performance of the hyper-heuristic

# Case Study 1: The Automated Design of Crossover Operators [20]

25 April, 2018

John R. Woodward, Daniel R. Tauritz

20

#### Motivation

- Performance Sensitive to Crossover Selection
- Identifying & Configuring Best Traditional Crossover is Time Consuming
- Existing Operators May Be Suboptimal
- Optimal Operator May Change During Evolution

25 April, 2018

John R. Woodward, Daniel R. Tauritz

#### Some Possible Solutions

- Meta-EA
  - Exceptionally time consuming
- Self-Adaptive Algorithm Selection
  - Limited by algorithms it can choose from

25 April, 2018

John R. Woodward, Daniel R. Tauritz

# Self-Configuring Crossover (SCX)

- Each Individual Encodes a Crossover Operator
- Crossovers Encoded as a List of Primitives
  - Swap
  - Merge
- Each Primitive has three parameters
  - Number, Random, or Inline

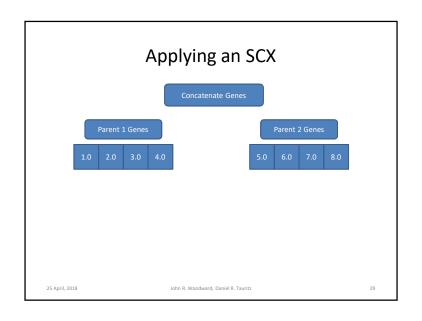

Offspring Crossover

Swap(3, 5, 2)

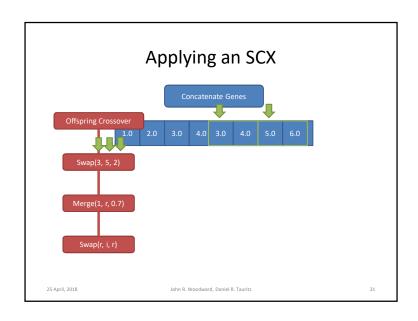

Merge(1, r, 0.7)

Swap(r, i, r)

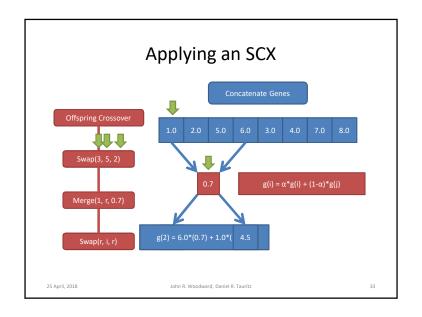

25 April, 2018

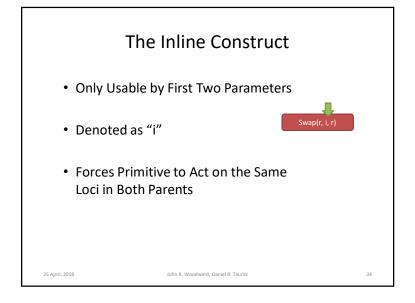

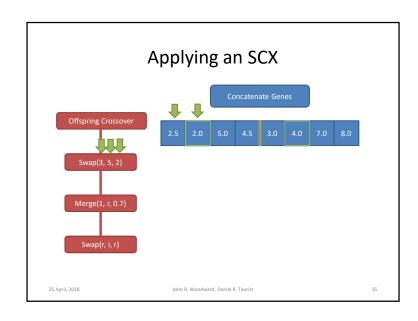

# The Swap Primitive Each Primitive has a type Swap represents crossovers that move genetic material First Two Parameters Start 1 Position Start 2 Position Third Parameter Primitive Dependent Swaps use "Width"

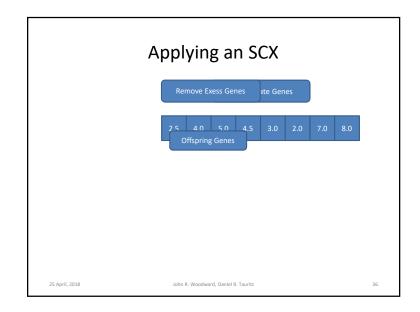

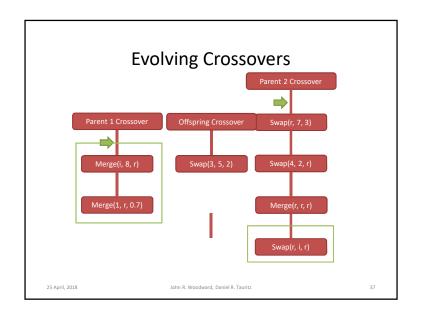

# The Merge Primitive Third Parameter Primitive Dependent Merges use "Weight" Random Construct All past primitive parameters used the Number construct "r" marks a primitive using the Random Construct Allows primitives to act stochastically

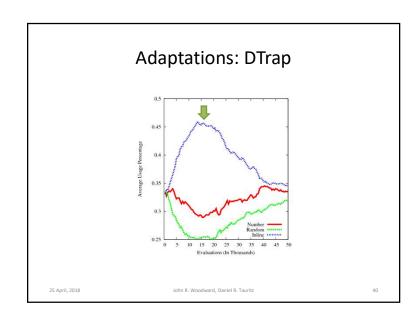

# **Empirical Quality Assessment**

- Compared Against
  - Arithmetic Crossover
  - N-Point Crossover
  - Uniform Crossover
- On Problems
  - Rosenbrock
  - Rastrigin
  - Offset Rastrigin
  - NK-Landscapes
  - DTrap

25 April, 2018

Problem	Comparison	SCX	
Rosenbrock	-86.94 (54.54)	-26.47 (23.33)	
Rastrigin	-59.2 (6.998)	-0.0088 (0.021)	
Offset Rastrigin	-0.1175 (0.116)	-0.03 (0.028)	
NK	0.771 (0.011)	0.8016 (0.013)	
DTrap	0.9782 (0.005)	0.9925 (0.021)	

	Adaptations: Rastrigin	
	0 1 2 3 4 5 6 7 8 9 10 Evaluations (In Thousands)	
25 April, 2018	John R. Woodward, Daniel R. Tauritz	39

#### SCX Overhead

- Requires No Additional Evaluation
- Adds No Significant Increase in Run Time
  - All linear operations
- Adds Initial Crossover Length Parameter
  - Testing showed results fairly insensitive to this parameter
  - Even worst settings tested achieved better results than comparison operators

25 April, 2018 John R. Woodward, Daniel R. Tauritz

Case Study 2: The Automated Design of Mutation Operators for Evolutionary Programming

25 April, 2018 John R. Woodward, Daniel R. Tauritz

#### **Conclusions**

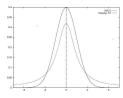

- Remove Need to Select Crossover Algorithm
- Better Fitness Without Significant Overhead
- Benefits From Dynamically Changing Operator
- Promising Approach for Evolving Crossover Operators for Additional Representations (e.g., Permutations)

25 April, 2018 John R. Woodward, Daniel R. Tauritz

# Designing Mutation Operators for Evolutionary Programming [18]

- Evolutionary programing optimizes functions by evolving a population of real-valued vectors (genotype).
- Variation has been provided (manually) by probability distributions (Gaussian, Cauchy, Levy).
- 3. We are automatically generating probability distributions (using genetic programming).
- Not from scratch, but from already well known distributions (Gaussian, Cauchy, Levy). We are "genetically improving probability distributions".
- We are evolving mutation operators for a problem class (probability distributions over functions).
- 6. NO CROSSOVER

Genotype is (1.3,...,4.5,...,8.7) Before mutation

Genotype is (1.2,...,4.4,...,8.6) After mutation

2018 John R. Woodward, Daniel R. Tauritz

44

# (Fast) Evolutionary Programming

Heart of algorithm is mutation SO LETS AUTOMATICALLY DESIGN

$$x_i'(j) = x_i(j) + \eta_i(j)D_j$$

- 1. EP mutates with a Gaussian
- 2. FEP mutates with a Cauchy
- A generalization is mutate with a distribution D (generated with genetic programming)

- Generate the initial population of μ individuals, and set k = 1. Each individual is taken as a pair of real-valued vectors, (x<sub>i</sub>, η<sub>i</sub>), ∀i ∈ {1, · · · , μ}.
- 2. Evaluate the fitness score for each individual  $(x_i, \eta_i)$ ,  $\forall i \in \{1, \dots, \mu\}$ , of the population based on the objective function,  $f(x_i)$ .
- Each parent (x<sub>i</sub>, η<sub>i</sub>), i = 1, · · · , μ, creates a single offspring (x<sub>i</sub>', η<sub>i</sub>') by: for j = 1, · · · , n,

$$\begin{split} \kappa(j) &= \kappa(j) * \kappa(j)/(n,1), \\ \kappa(j) &= \kappa(j) * \kappa(j)/(n,1) + \kappa(j,0,1) \\ \kappa(j) &= \kappa(j,n,1) \\ \kappa(j) * \kappa(j) * \kappa(j) * \kappa(j,n,1) \\ \kappa(j) &= \kappa(j,n,1) \\ \kappa(j)$$

- 4. Calculate the fitness of each offspring  $(x_i', \eta_i')$ ,  $\forall i \in \{1, \dots, u\}$ .
- (1.····/I). Conduct pairwise comparison over the union of parents (x<sub>1</sub>, y<sub>1</sub>) and offspring (x<sub>1</sub>, y<sub>1</sub>), \(\nu \) \(\text{i.i.} \) (1.····/I). For each individual, \(\nu \) oponests are chosen and only from all the parents and offspring with an equal probability. For each comparison, if the individual is fitness is no greater than the opponent \(\nu \), it receives \(\nu \) \(\nu \).
- Select the μ individuals out of (x<sub>i</sub>, η<sub>i</sub>) and (x<sub>i</sub>', η<sub>i</sub>'),
   ∀i ∈ {1, ···, μ}, that have the most wins to be parents of the next generation.
- 7. Stop if the stopping criterion is satisfied; otherwise, k=k+1 and go to Step 3.

25 April, 2018

John R. Woodward, Daniel R. Tauritz

ΛC

#### **Optimization & Benchmark Functions**

A set of 23 benchmark functions is typically used in the literature. **Minimization**  $\forall x \in S : f(x_{min}) \leq f(x)$  We use them as **problem classes**.

Table 1: The 23 test functions used in our experimental studies, where n is the dimension of the function,  $f_{min}$ the minimum value of the function, and  $S \subseteq B^n$ 

Test function	72	S	$f_{min}$
$f_1(x) = \sum_{i=1}^{n} x_i^2$	30	$[-100, 100]^n$	0
$f_2(x) = \sum_{i=1}^{n}  x_i  + \prod_{i=1}^{n}  x_i $	30	$[-10, 10]^n$	0
$f_3(x) = \sum_{i=1}^{n} (\sum_{j=1}^{i} x_j)^2$	30	$[-100, 100]^n$	0
$f_4(x) = \max_i \{ x_i , 1 \le i \le n\}$	30	$[-100, 100]^n$	0
$f_5(x) = \sum_{i=1}^{n-1} [100(x_{i+1} - x_i^2)^2 + (x_i - 1)^2]$	30	$[-30, 30]^n$	0
$f_6(x) = \sum_{i=1}^{n} [x_i + 0.5]$	30	$[-100, 100]^n$	0
$f_7(x) = \sum_{i=1}^{n} ix_i^4 + random[0, 1)$	30	$[-1.28, 1.28]^n$	0
$f_8(x) = \sum_{i=1}^{n} -x_i \sin(\sqrt{ x_i })$	30	$[-500, 500]^n$	-12569.3
$f_9(x) = \sum_{i=1}^{n} [x_i^2 - 10 \cos(2\pi x_i) + 10)]$	30	$[-5.12, 5.12]^n$	0
$f_{10}(x) = -20 \exp \left(-0.2 \sqrt{\frac{1}{n} \sum_{i=1}^{n} x_i^2}\right) - \exp \left(\frac{1}{n} \sum_{i=1}^{n} \cos 2\pi x_i\right)$	30	$[-32, 32]^n$	0
+20 + e			

25 April, 2018 John R. Woodward, Daniel R. Tauritz

#### **Function Class 1**

- 1. Machine learning needs to generalize.
- 2. We generalize to function classes.
- 3.  $y = x^2$  (a function)
- 4.  $y = ax^2$  (parameterised function)
- 5.  $y = ax^2$ ,  $a \sim [1,2]$  (function class)
- 6. We do this for all benchmark functions.
- 7. The mutation operators is evolved to fit the probability distribution of functions.

**Function Classes 2** 

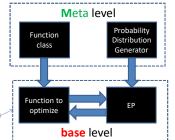

Function Classes	S	b	$f_{min}$
$f_1(x) = a \sum_{i=1}^{n} x_i^2$	$[-100, 100]^n$	N/A	0
$f_2(x) = a \sum_{i=1}^{n}  x_i  + b \prod_{i=1}^{n}  x_i $	$[-10, 10]^n$	$b \in [0, 10^{-5}]$	0
$f_3(x) = \sum_{i=1}^{n} (a \sum_{j=1}^{i} x_j)^2$	$[-100, 100]^n$	N/A	0
$f_4(x) = \max_i \{ a \mid x_i \mid, 1 \le i \le n \}$	$[-100, 100]^n$	N/A	0
$f_5(x) = \sum_{i=1}^{n} [a(x_{i+1} - x_i^2)^2 + (x_i - 1)^2]$	$[-30, 30]^n$	N/A	0
$f_6(x) = \sum_{i=1}^{n} (\lfloor ax_i + 0.5 \rfloor)^2$	$[-100, 100]^n$	N/A	0
$f_7(x) = a \sum_{i=1}^{n} ix_i^4 + random[0, 1)$	$[-1.28, 1.28]^n$	N/A	0
$f_8(x) = \sum_{i=1}^n -(x_i \sin(\sqrt{ x_i }) + a)$	$[-500, 500]^n$	N/A	[-12629.5, -12599.5]
$f_9(x) = \sum_{i=1}^{n} [ax_i^2 + b(1 - \cos(2\pi x_i))]$	$[-5.12, 5.12]^n$	$b \in [5, 10]$	0
$f_{10}(x) = -a \exp(-0.2\sqrt{\frac{1}{n}\sum_{i=1}^{n} x_i^2})$	$[-32, 32]^n$	N/A	0
$-\exp(\frac{1}{n}\sum_{i=1}^{n}\cos 2\pi x_i) + a + e$			

ril, 2018 John R. Woodward, Daniel R. Tauritz

25 April, 2018

- At the base level we are learning about a specific function.
- At the meta level we are learning about the problem class.
- We are just doing "generate and test" at a higher level
- What is being passed with each blue arrow?
- Conventional EP

25 April, 2018

25 April, 2018

John R. Woodward, Daniel R. Tauritz

#### **Compare Signatures (Input-Output)**

Evolutionary Programming

 $(R^n \rightarrow R) \rightarrow R^n$ 

Input is a function mapping real-valued vectors of length n to a real-value.

**Output** is a (near optimal) real-valued vector

(i.e. the <u>solution</u> to the problem <u>instance</u>)

Evolutionary Programming Designer

 $[(R^n \rightarrow R)] \rightarrow ((R^n \rightarrow R) \rightarrow R^n)$ 

**Input** is a *list of* functions mapping real-valued vectors of length n to a real-value (i.e. sample problem instances from the problem class).

Output is a (near optimal) (mutation operator for) Evolutionary Programming (i.e. the solution method to the problem class)

We are raising the level of generality at which we operate.

25 April, 2018

John R. Woodward. Daniel R. Tauritz

# Genetic Programming to Generate Probability Distributions

- 1. GP Function Set {+, -, \*, %}
- 2. GP **Terminal Set** {N(0, random)} N(0,1) is a normal distribution.

For example a Cauchy distribution is generated by N(0,1)%N(0,1).

Hence the search space of probability distributions contains the two existing probability distributions used in EP but also novel probability distributions.

SPACE OF PROBABILITY DISTRIBUTIONS

GAUSSIAN CAUCHY

NOVEL PROBABILITY DISTRIBUTIONS

John R. Woodward, Daniel R. Tauritz

### **Means and Standard Deviations**

These results are good for two reasons.

- 1. starting with a manually designed distributions (Gaussian).
- 2. evolving distributions for each function class.

Function	FI	EP	Cl	EP	GP-dist	ribution
Class	$Mean\ Best$	$Std\ Dev$	Mean Best	$Std\ Dev$	Mean Best	Std Dev
$f_1$	$1.24 \times 10^{-3}$	$2.69 \times 10^{-4}$	$1.45 \times 10^{-4}$	$9.95 \times 10^{-5}$	6.37×10-5	$5.56 \times 10^{-5}$
$f_2$	$1.53 \times 10^{-1}$	$2.72 \times 10^{-2}$	$4.30 \times 10^{-2}$	$9.08 \times 10^{-3}$	8.14×10-4	$8.50 \times 10^{-4}$
	$2.74 \times 10^{-2}$	$2.43 \times 10^{-2}$	$5.15 \times 10^{-2}$	$9.52 \times 10^{-2}$	6.14×10-5	8.78×10 <sup>-3</sup>
$f_4$	1.79	1.84	$1.75 \times 10$	6.10	$2.16 \times 10^{-1}$	$6.54 \times 10^{-1}$
$f_4$ $f_5$	$2.52 \times 10^{-3}$	$4.96 \times 10^{-4}$	$2.66 \times 10^{-4}$	$4.65 \times 10^{-5}$	8.39×10-7	$1.43 \times 10^{-7}$
$f_6$	$3.86 \times 10^{-2}$	$3.12 \times 10^{-2}$	$4.40 \times 10$	$1.42 \times 10^{2}$	$9.20 \times 10^{-3}$	$31.34 \times 10^{-2}$
$f_7$	$6.49 \times 10^{-2}$	$1.04 \times 10^{-2}$	$6.64 \times 10^{-2}$	$1.21 \times 10^{-2}$	$5.25 \times 10^{-2}$	8.46×10 <sup>-3</sup>
$f_8$	-11342.0	$3.26 \times 10^{2}$	-7894.6	$6.14 \times 10^{2}$	-12611.6	$2.30 \times 10$

25 April, 2018 John R. Woodward, Daniel R. Tauritz

> Case Study 3: The Automated Design of On-Line Bin Packing Algorithms

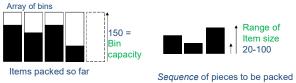

25 April, 2018 John R. Woodward, Daniel R. Tauritz

#### **Performance on Other Problem Classes**

25 April. 2018 John R. Woodward, Daniel R. Tauritz

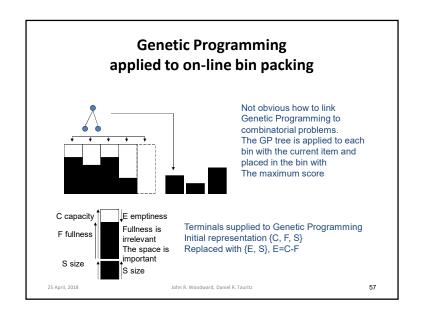

# **On-line Bin Packing Problem [9,11]**

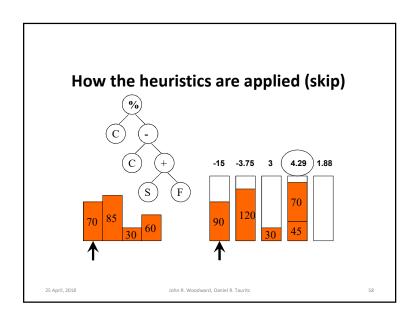

- · A sequence of items packed into as few a bins as possible.
- Bin size is 150 units, items uniformly distributed between 20-100.
- Different to the off-line bin packing problem where the set of items.
- The "best fit" heuristic, places the current item in the space it fits best (leaving least slack).
- · It has the property that this heuristic does not open a new bin unless it is forced to.

56

John R. Woodward, Daniel R. Tauritz 25 April, 2018

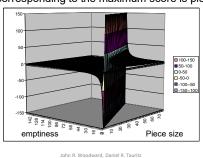

#### The Best Fit Heuristic

Best fit = 1/(E-S). Point out features.

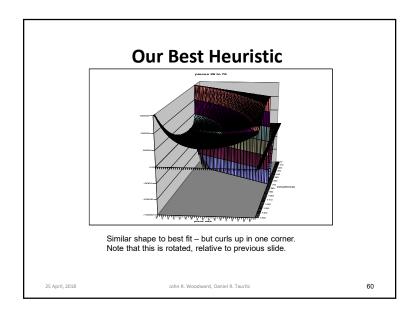

25 April, 2018

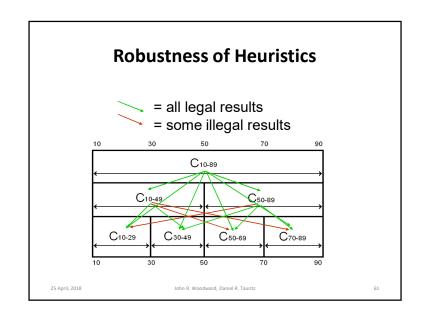

Pieces of size S, which fit well into the space remaining E, score well.

Best fit applied produces a set of points on the surface, The bin corresponding to the maximum score is picked.

59

# **Testing Heuristics on problems of much larger** size than in training

Table I	H trained100	H trained 250	H trained 500
100	0.427768358	0.298749035	0.140986023
1000	0.406790534	0.010006408	0.000350265
10000	0.454063071	2.58E-07	9.65E-12
100000	0.271828318	1.38E-25	2.78E-32

Table shows p-values using the best fit heuristic, for heuristics trained on different size problems, when applied to different sized problems

- 1. As number of items trained on increases, the probability decreases (see
- 2. As the number of items packed increases, the probability decreases (see next slide).

April. 2018 John R. Woodward, Daniel R. Tauritz

#### **Compared with Best Fit** Amount the heuristics beat best fit by Amount evolved heuristics beat best fit by. evolved on 25 Number of pieces 40000 60000 80000 1000000 packed so far. Averaged over 30 heuristics over 20 problem instances • Performance does not deteriorate • The larger the training problem size, the better the bins are packed. 25 April, 2018 John R. Woodward, Daniel R. Tauritz 63

#### **Compared with Best Fit** Amount the heuristics beat best fit by Zoom in of previous slide Amount evolved on 10 evolved on 25 evolved 100 150 200 250 300 350 heuristics beat best fit by.

- · The heuristic seems to learn the number of pieces in the problem
- Analogy with sprinters running a race accelerate towards end of race.
- The "break even point" is approximately half of the size of the training problem
- If there is a gap of size 30 and a piece of size 20, it would be better to wait for a better piece to come along later – about 10 items (similar effect at upper bound?).

64

25 April, 2018 John R. Woodward, Daniel R. Tauritz

# Step by Step Guide to Automatic Design of Algorithms [8, 12]

- 1. Study the literature for existing heuristics for your chosen domain (manually designed heuristics).
- 2. Build an algorithmic framework or template which expresses the known heuristics.
- 3. Let metaheuristics (e.g. Genetic Programming) search for *variations on the theme*.
- Train and test on problem instances drawn from the same probability distribution (like machine learning). Constructing an optimizer is machine learning (this approach prevents "cheating").

John R. Woodward, Daniel R. Tauritz

# A Paradigm Shift?

One person proposes one algorithm and tests it in isolation.

conventional approach

One person proposes a family of algorithms and tests them in the context of a problem class.

machine cost MOORE'S LAW new approach

- Previously one person proposes one algorithm
- Now one person proposes a set of algorithms
- Analogous to "industrial revolution" from hand made to machine made. Automatic Design.

25 April, 2018

John R. Woodward, Daniel R. Tauritz

#### Conclusions

- Heuristic are trained to fit a problem class, so are designed in context (like evolution). Let's close the feedback loop! Problem instances live in classes.
- We can design algorithms on small problem instances and scale them apply them to large problem instances (TSP, child multiplication).

25 April, 2018

#### **SUMMARY**

- 1. We can automatically design algorithms that consistently outperform human designed algorithms (on various domains).
- The "best" heuristics depends on the set of problem instances. (feedback)
- Resulting algorithm is part man-made part machinemade (synergy)
- 4. not evolving from scratch like Genetic Programming,
- 5. improve existing algorithms and adapt them to the new problem instances.
- 6. Algorithms are **reusable**, "solutions" aren't. (e.g. tsp algorithm vs route)

25 April, 2018

Case Study 4: The Automated Design of Black Box Search Algorithms [21, 23, 25]

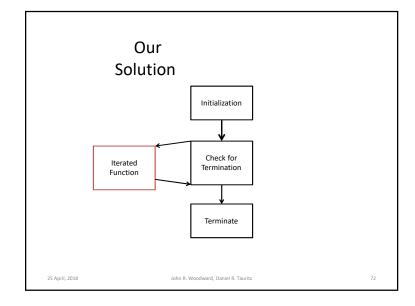

John R. Woodward, Daniel R. Tauritz

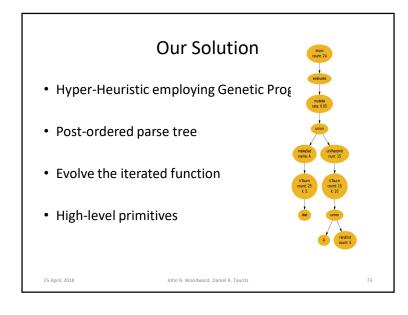

25 April, 2018

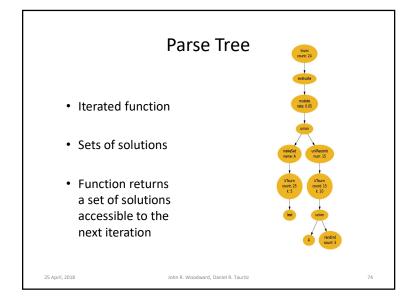

# Approach

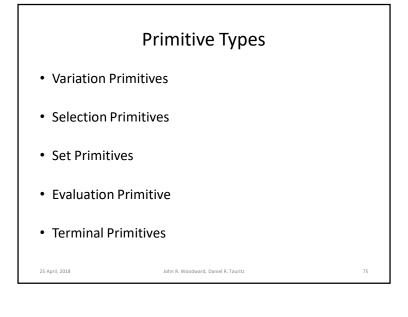

- Hyper-Heuristic employing Genetic Programing
- Post-ordered parse tree
- Evolve the iterated function

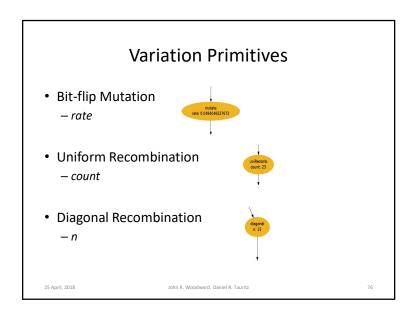

25 April, 2018

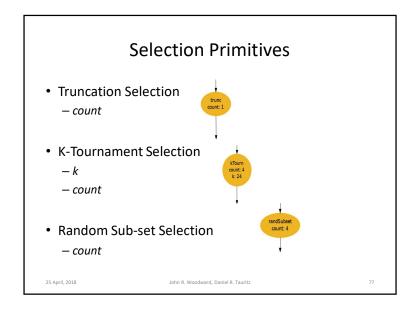

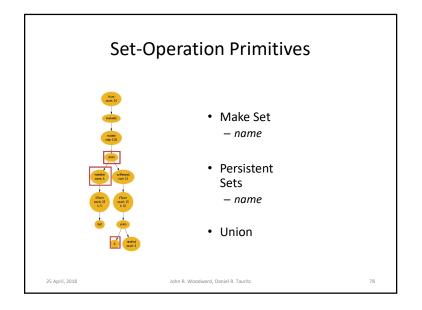

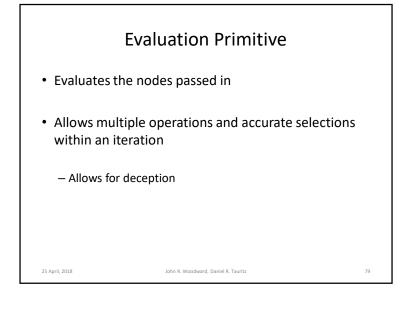

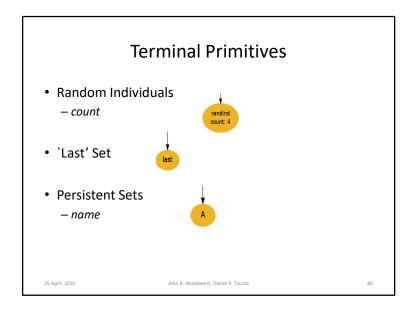

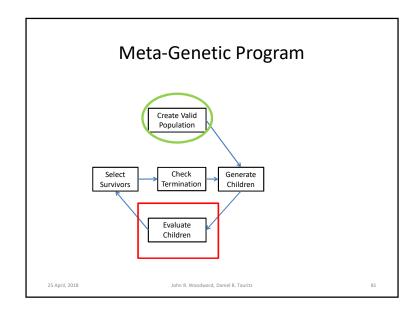

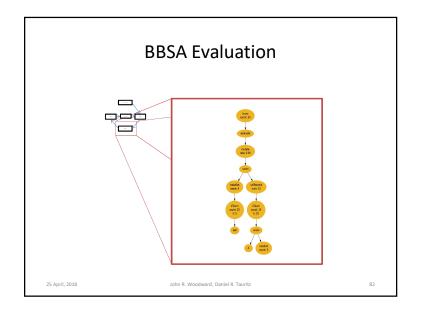

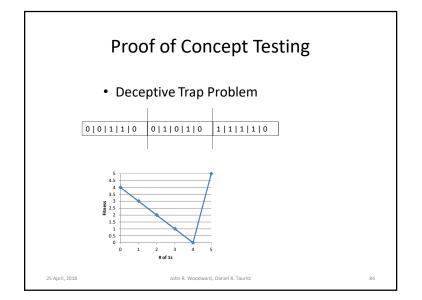

# Termination Conditions

- Evaluations
- Iterations
- Operations
- Convergence

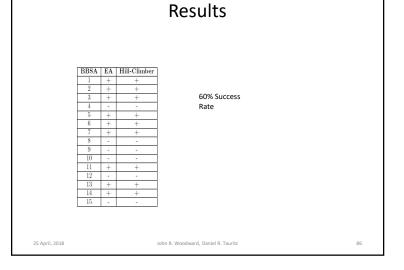

25 April, 2018

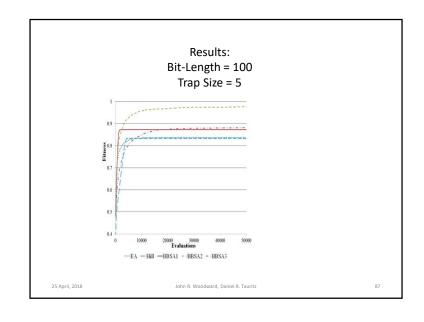

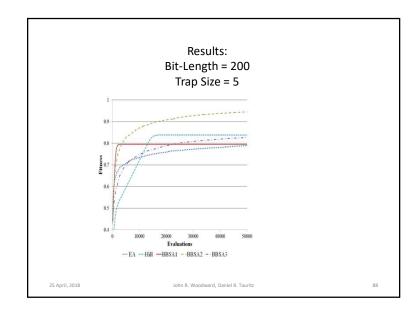

# Proof of Concept Testing (cont.)

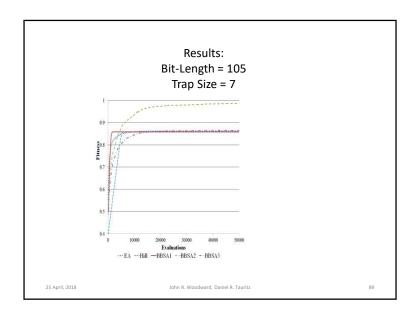

- Evolved Problem Configuration
  - Bit-length = 100
  - Trap Size = 5
- Verification Problem Configurations
  - Bit-length = 100, Trap Size = 5
  - Bit-length = 200, Trap Size = 5
  - Bit-length = 105, Trap Size = 7
  - Bit-length = 210, Trap Size = 7

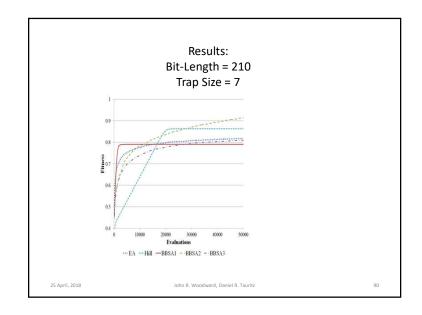

25 April, 2018

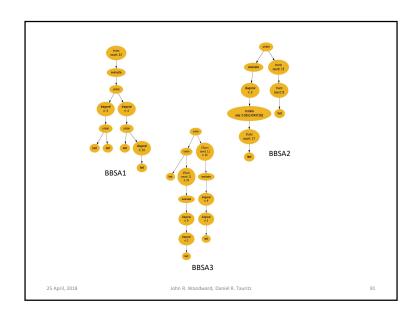

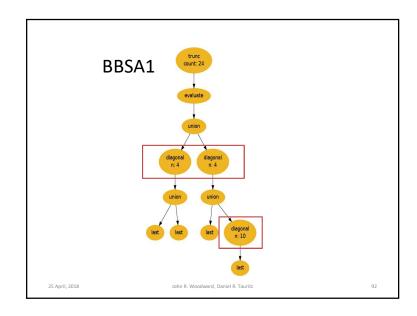

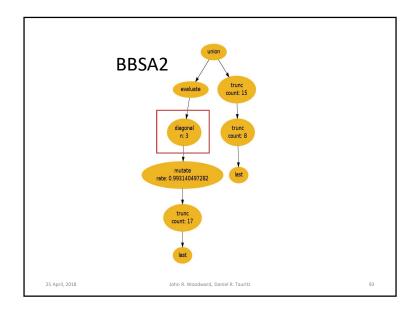

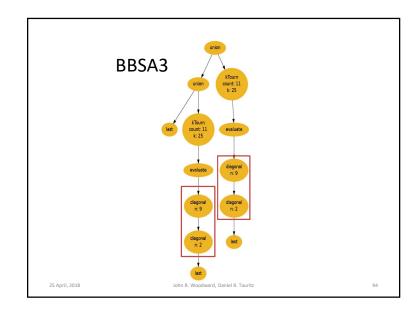

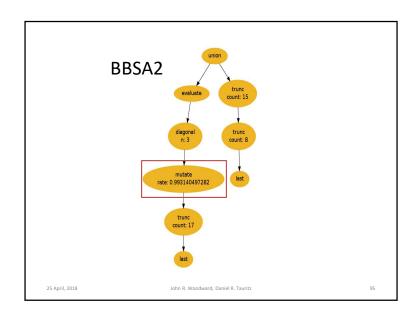

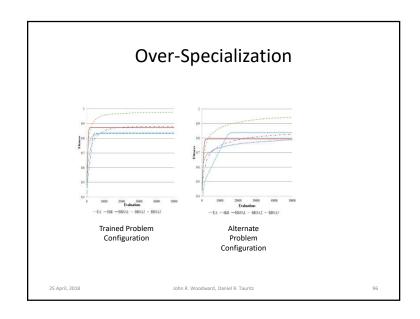

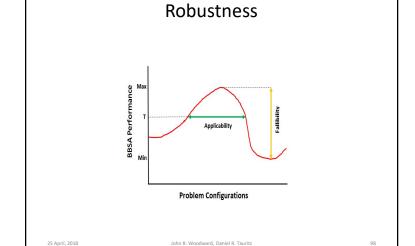

#### Robustness

- Measures of Robustness
  - Applicability
  - Fallibility
- Applicability
  - What area of the problem configuration space do I perform well on?
- Fallibility
  - If a given BBSA doesn't perform well, how much worse will I perform?

25 April, 2018

John R. Woodward, Daniel R. Tauritz

# **Multi-Sampling**

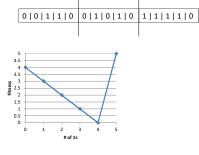

- Train on multiple problem configurations
- Results in more robust BBSAs
- Provides the benefit of selecting the region of interest on the problem configuration landscape

John R. Woodward, Daniel R. Tauritz

• Deceptive Trap Problem

# Multi-Sample Testing (cont.)

- Multi-Sampling Evolution
  - Levels 1-5
- Training Problem Configurations
  - 1. Bit-length = 100, Trap Size = 5
  - 2. Bit-length = 200, Trap Size = 5
  - 3. Bit-length = 105, Trap Size = 7
  - 4. Bit-length = 210, Trap Size = 7
  - 5. Bit-length = 300, Trap Size = 5

25 April, 2018

John R. Woodward, Daniel R. Tauritz

### **Initial Test Problem Configurations**

- 1. Bit-length = 100, Trap Size = 5
- 2. Bit-length = 200, Trap Size = 5
- 3. Bit-length = 105, Trap Size = 7
- 4. Bit-length = 210, Trap Size = 7
- 5. Bit-length = 300, Trap Size = 5
- 6. Bit-length = 99, Trap Size = 9
- 7. Bit-length = 198, Trap Size = 9
- 8. Bit-length = 150, Trap Size = 5
- Bit-length = 250, Trap Size = 5
- 10. Bit-length = 147, Trap Size = 7
- 11. Bit-length = 252, Trap Size = 7

25 April, 2018

John R. Woodward, Daniel R. Tauritz

#### Initial Results

Level	Run	Train Fit.	Test Fit.	Fallibility
1	1	1.0	0.976	0.094
1	2	1.0	0.999	8.33 E-3
1	3	0.944	0.883	0.082
1	4	0.976	0.894	0.224
2	1	0.997	0.996	0.023
2	2	0.992	0.959	0.130
2	3	0.966	0.970	0.054
2	4	0.979	0.947	0.120
3	1	0.965	0.966	0.050
3	2	0.984	0.980	0.065
3	3	0.899	0.886	0.059
3	4	0.926	0.898	0.073
4	1	0.976	0.999	5.00 E-3
4	2	0.973	0.969	.0903
4	3	0.982	0.975	0.059
4	4	0.993	0.999	5.00 E-3
5	1	0.973	0.977	0.050
5	2	0.893	0.879	0.035
5	3	0.850	0.850	0.045
5	4	0.955	0.986	0.029

Level	Run	+	~	-
1	1	11	0	0
1	2	11	0	0
1	3	11	0	0
1	4	6	2	3
2	1	11	0	0
2	2	11	0	0
2	3	11	0	0
2	4	11	0	0
3	1	11	0	0
3	2	11	0	0
3	3	11	0	0
3	4	11	0	0
4	1	11	0	0
4	2	11	0	0
4	3	11	0	0
4	4	11	0	0
5	1	11	0	0
5	2	10	1	0
5	3	7	4	0
5	4	11	0	0

25 April, 2018

John R. Woodward, Daniel R. Tauritz

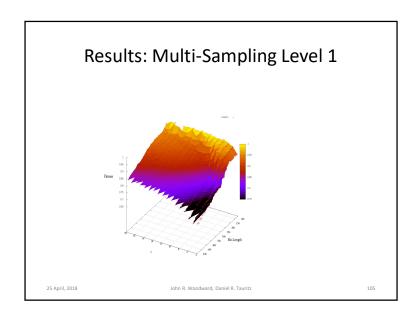

# **Problem Configuration Landscape Analysis**

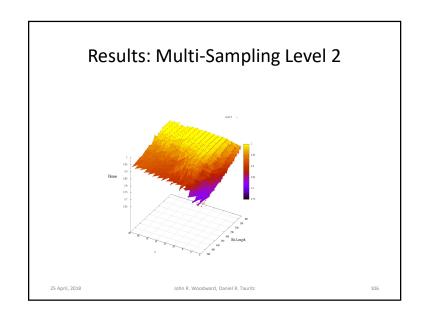

- Run evolved BBSAs on wider set of problem configurations
- Bit-length: ~75-~500
- Trap Size: 4-20

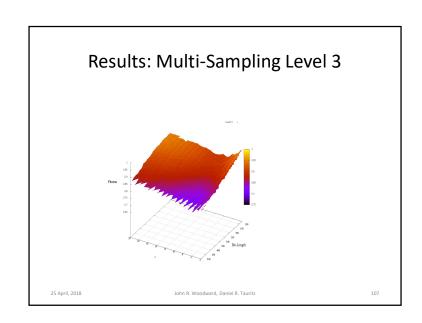

25 April, 2018

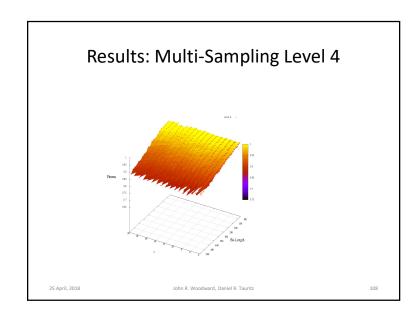

John R. Woodward, Daniel R. Tauritz

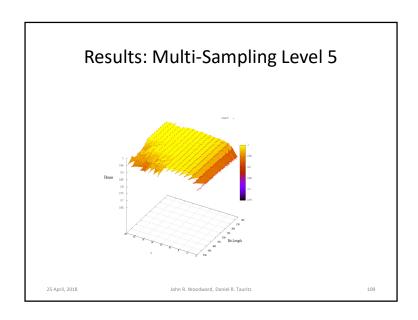

104

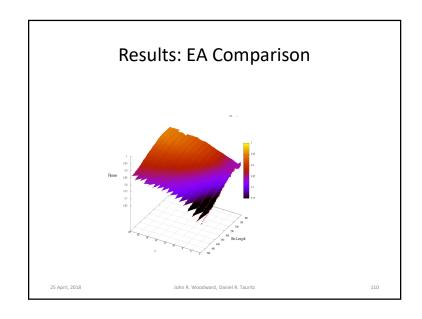

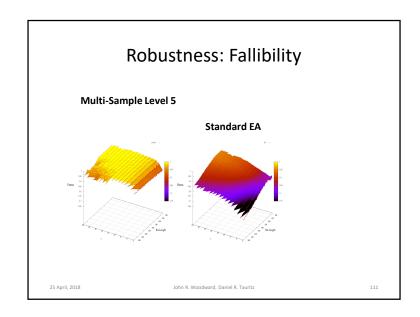

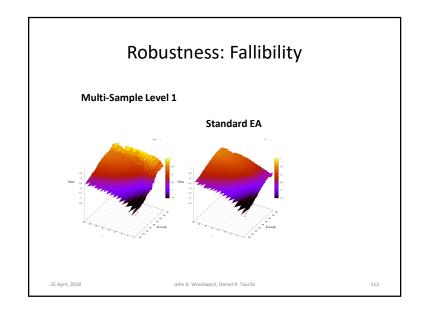

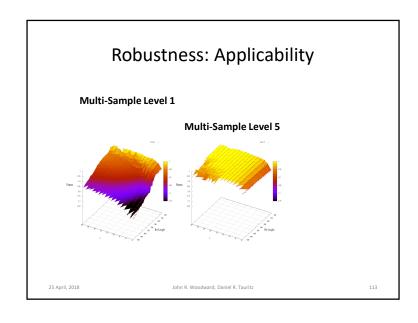

# Robustness: Fallibility

Level	Run	Train Fit.	Test Fit.	Fallibility
5	1	0.973	0.977	0.050
5	2	0.893	0.879	0.035
5	3	0.850	0.850	0.045
5	4	0.955	0.986	0.029

25 April, 2018 John R. Woodward, Daniel R. Tauritz

#### **Drawbacks**

- Increased computational time
  - More runs per evaluation (increased wall time)
  - More problem configurations to optimize for (increased evaluations)

# Summary of Multi-Sample Improvements

- Improved Hyper-Heuristic to evolve more robust BBSAs
- Evolved custom BBSA which outperformed standard EA and were robust to changes in problem configuration

# Case Study 5: Evolving Random Graph Generators: A Case for Increased Algorithmic Primitive Granularity [27]

25 April, 2018

in R. Woodward. Daniel R. Taurit

# Random Graphs

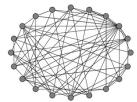

- Graphs are a powerful modeling tool
  - Computer and social networks
  - Transportation and power grids
- · Algorithms designed for graphs
  - Community detection and graph partitioning
  - Network routing and intrusion detection
- Random graphs provide test data
- Prediction using random graphs
  - Spread of disease
  - Deployment of wireless sensors

# **Traditional Random Graph Models**

• Erdös-Rényi

Barabási-Albert

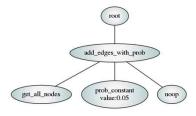

#### Automated Random Graph Model Design

- Random graph model needs to accurately reflect intended concept
- Model selection can be automated, but relies on having a good solution available
- Developing an accurate model for a new application can be difficult

Can the model design process be automated to produce an accurate graph model given examples?

# Hyper-heuristic Approach

- Extract functionality from existing graph generation techniques
- Use Genetic Programming (GP) to construct new random graph algorithms

# Previous Attempts at Evolving Random Graph Generators

- Assumes "growth" model, adding one node at a time
- Does well at reproducing traditional models
- Not demonstrated to do well at generating real complex networks
- Limits the search space of possible solutions

# Increased Algorithmic Primitive Granularity

- Remove the assumed "growth" structure
- More flexible lower-level primitive set
- Benefit: Can represent a larger variety of algorithms
- Drawback: Larger search space, increasing complexity

# Methodology

- NSGA-II evolves population of random graph models
- Strongly typed parse tree representation
- Centrality distributions used to evaluate solution
- quality (degree, betweenness, PageRank)

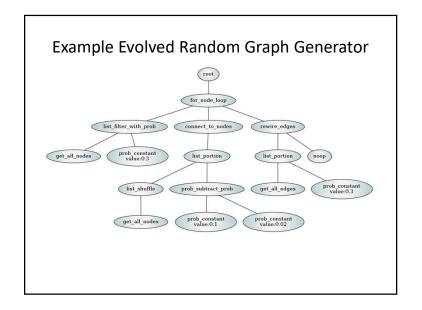

# **Primitive Operations**

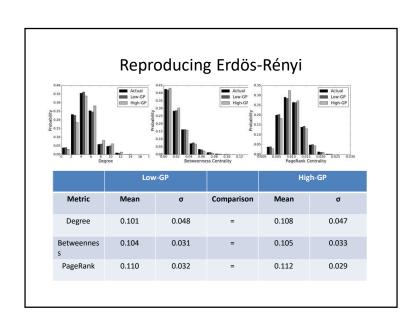

#### Terminals

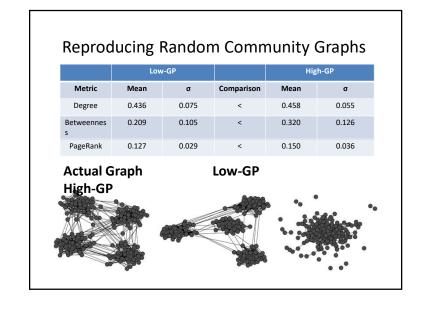

- Graph elements: nodes, edges
- Graph properties: average degree, size, order
- Constants: integers, probabilities, Booleans, user inputs
- No-op terminators

#### **Functions**

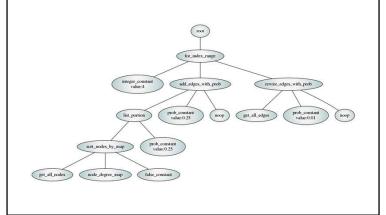

- Basic programming constructs: for, while, if-else
- Data structures: lists of values, nodes, or edges, list
- combining/selection/sorting
- Math and logic operators: add, multiply, <, ==, AND, OR
- Graph operators: add edges, add subgraph, rewire edges

# Evolved Random Collaboration Network Generator

#### Conclusion

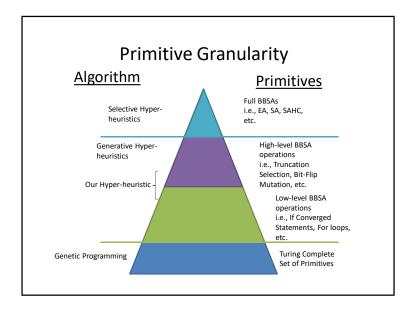

- Traditional random graph models do not always produce appropriate representations of certain concepts
- Accurate random graph model design can be automated using genetic programming
- More flexible set of low-level primitive operations increases resulting model accuracy
- Increase in a priori evolution time is amortized over repeated use of the evolved solutions

#### Some Final Thoughts

25 April, 2018 John R. Woodward, Daniel R. Tauritz

## Challenges in Hyper-heuristics

- Hyper-heuristics are very computationally expensive (use Asynchronous Parallel GP [26,30])
- What is the best primitive granularity? (see next slide)
- How to automate decomposition and recomposition of primitives?
- How to automate primitive extraction?
- How does hyper-heuristic performance scale for increasing primitive space size? (see [25,27])
